Nordic immunohistochemical Quality Control

NordiQC

# Workshop in Diagnostic Immunohistochemistry
# Aalborg University Hospital, 2-4 October 2019

## Technical aspects of immunohistochemistry & pitfalls
## Pre-Analytical - Analytical (I & II) - Post Analytical phase

**Michael Bzorek**

**Histotechnologist**

**Department of Surgical Pathology**

**University Hospital, Region Zealand, Denmark**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**The total test paradigm:**
**Key elements in the IHC procedure**

## The Analytic phase :

**Begins with dewax of the cut slides and is completed with the coverslipping of the stained slides.**

**Unlike the pre-analytic factors, analytic factors (excentric to the tissue block) can be modified and controlled within the immunohistology laboratory.**

### Pre-analytic phase

Pre-fixation
Fixation
Post-Fixation/Decalcification
Processing
Dehydration & clearing
Paraffin embedding
Sectioning
Drying/Storage

### Analytic phase

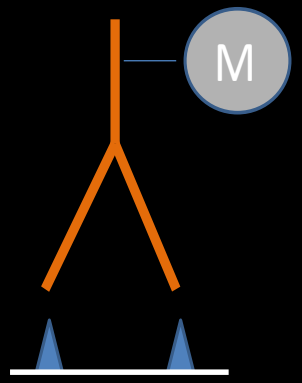
Platform (manual/ Automated)
Epitope retrieval
Blocking
Primary Antibody
Detection system
Chromogen
Counterstain
Mounting

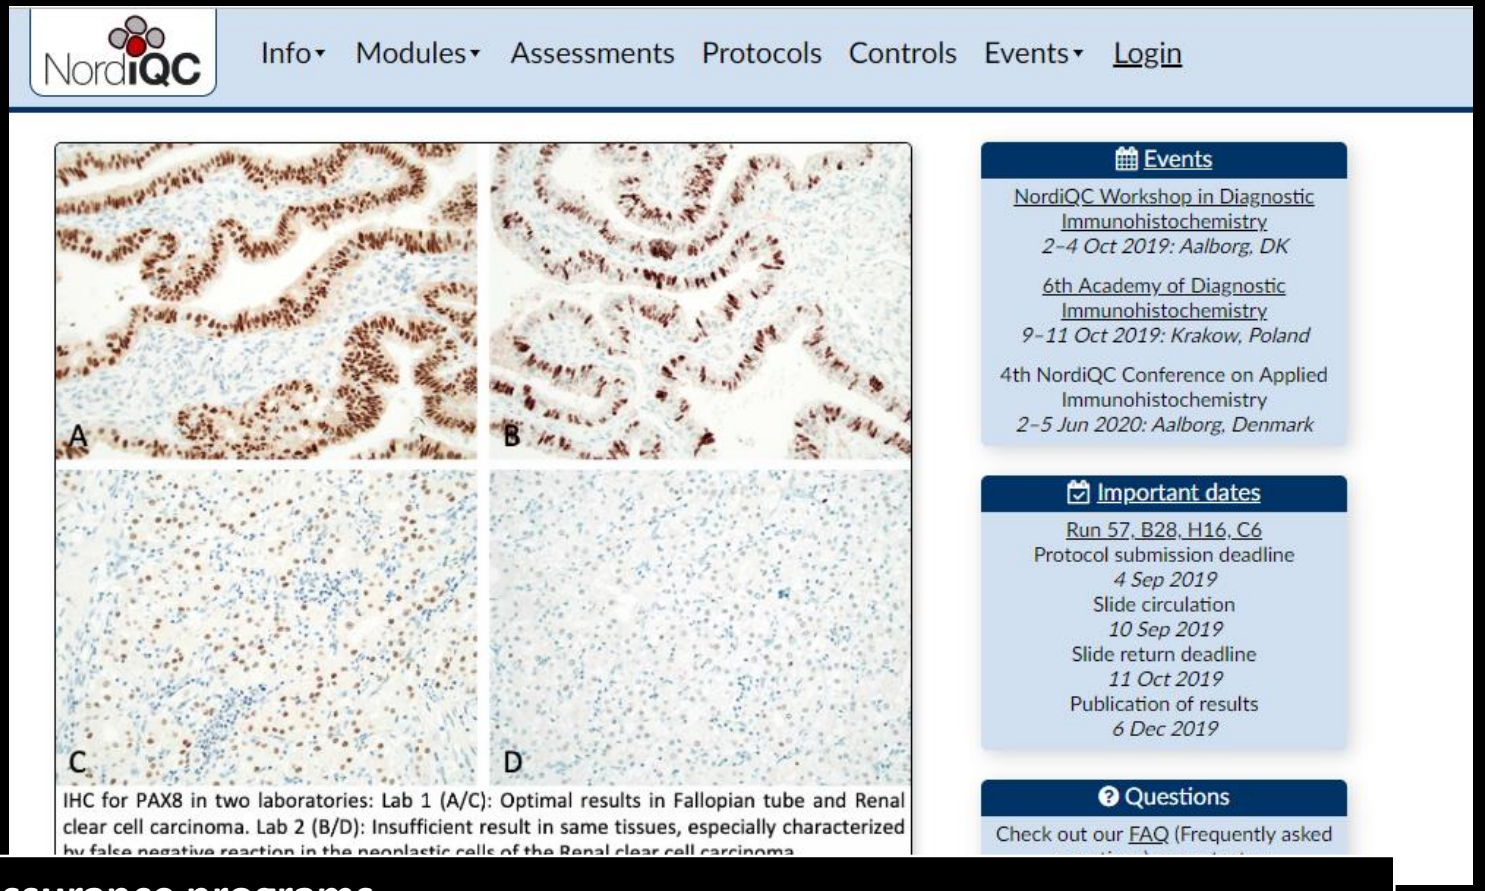
### Post-analytic phase

Design of controls
Critical stain indicators
Internal/External control
Interpretation
Positive/Negative
Localization
Quantification
Cutt-of levels
Reporting

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Immunohistochemistry – A simple technique ?





**External Quality Assurance programs**

**Staining quality varies greatly between different laboratories depending on the individual selection of methods and the technical expertise**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Optimization of the IHC assay - topics to be addressed

- Purpose and intended use of an IHC test
- How to establish "best practice protocol" of the IHC test (Calibration of the IHC assay with focus clone, antigen retrieval, titer & detection system)
- How to validate (technical) the IHC-test
  - Is the IHC test reproducible/robust (preanalytic conditions)
  - Evaluation of the analytical sensitivity and specificity
- Identification of most robust controls providing information that the established level of detection is obtained in each test performed in daily practice.

Tissue materials are essential for these processes (calibration, validation and controls)

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**Immunohistochemistry: Calibration of a biomarker/antibody may vary depending on IHC-type (1&2)**

## IHC-type 1 markers (Diagnostic)

**Often calibrated to produced the highest level of sensitivity and specificity (positive versus negative)**

## IHC-type 2 markers (Disease screening, predictive treatment & prognosis)

**Predictive markers: The assays are calibrated to provide information of which patients will or will not benefit from a specific treatment (HER-2, PD-L1 …….)**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Purpose and Intended use

**Melan A (MLA)/MART-1**
IHC-Type 1 marker

**Malignant melanoma** → **Optimal results (NQC run 56)**

mAb A103
mAb BS52
mAb M2-7C10
rmAb EP43

**Steroid producing tumors (e.g. Granulosa cell tumor of the ovary)** → **Optimal results (NQC run 56)**

mAb A103

Table 1. **Antibodies and assessment marks for MLA, Run 56**

1) Proportion of sufficient stains (optimal or good)
2) Proportion of sufficient stains with optimal protocol settings only, see below.
3) RTU system developed for the Dako/Agilent semi-automatic system (Dako Autostainer), but used b
fully-automatic platform (Dako Omins)
4) RTU system developed for the Dako/Agilent semi-automatic system (Dako Autostainer), but used b
platforms (e.g. Ventana BenchMark)
5) RTU system developed for the Leica Bond system, but used on the Ventana BenchMark system.

# Purpose and Intended use

## Melan A/MART-1 (melanoma assessment)/Run 56

**MLA, A103 (melanoma assessment): Suff. 60%**

**- Opt. results - Efficient HIER (Alkaline buffer), High conc. of the primary Ab (app. 1:50) and a sensitive detection system (3-step)**

**MLA, A103 (melanoma + steroid hormone assessment): Suff. 29%**

**- Autostainer (Dako)** ☺

**- Benchmark (Ventana), Omnis (Dako) and Bond (Leica)** ☹

**Melan A (MLA) / MART-1:**

265 participants ~ 93% used clone A103 (single or in cocktail antibody solutions)

Is MLA , A103 the best primary Ab for detection of melanomas ?

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**MLA, A103**

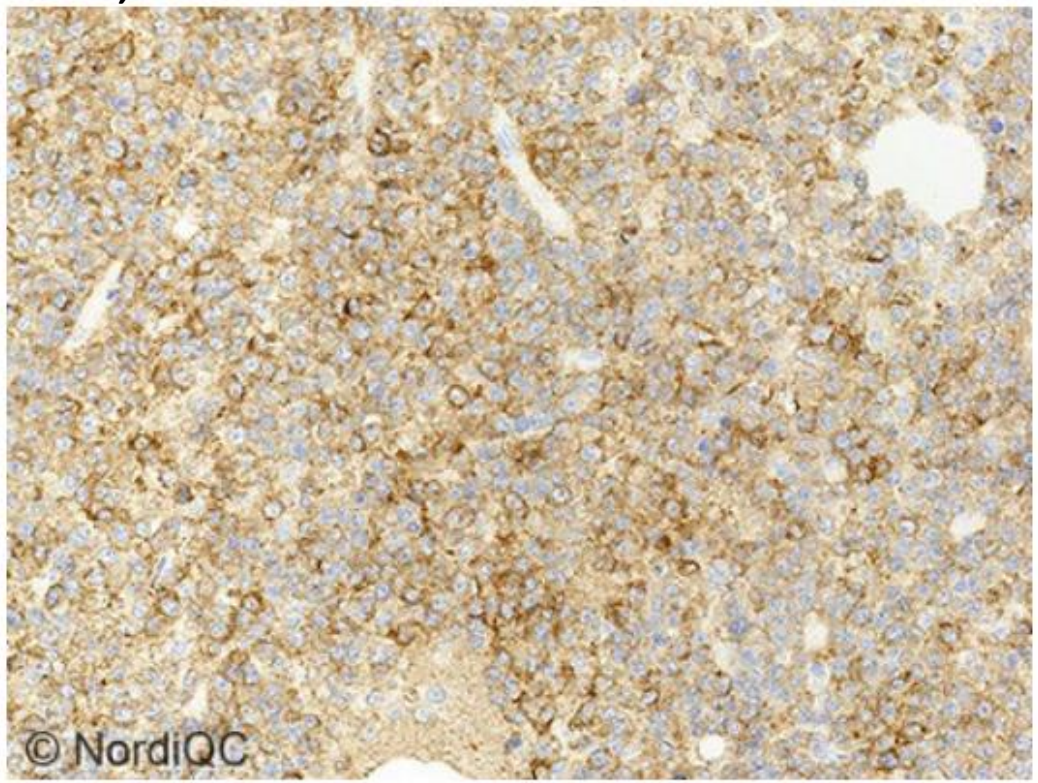

Fig. 8a
Optimal MLA staining of the malignant melanoma tissue core no. 4 (low-level expressor) using same protocol as in Figs. 7a and 7b. The majority of neoplastic cells show a weak to moderate cytoplasmic staining reaction. Compare with Figs. 7a and 8b, same protocol. Also compare with Figs. 5a and 5b - same field.

**MLA, EP43**

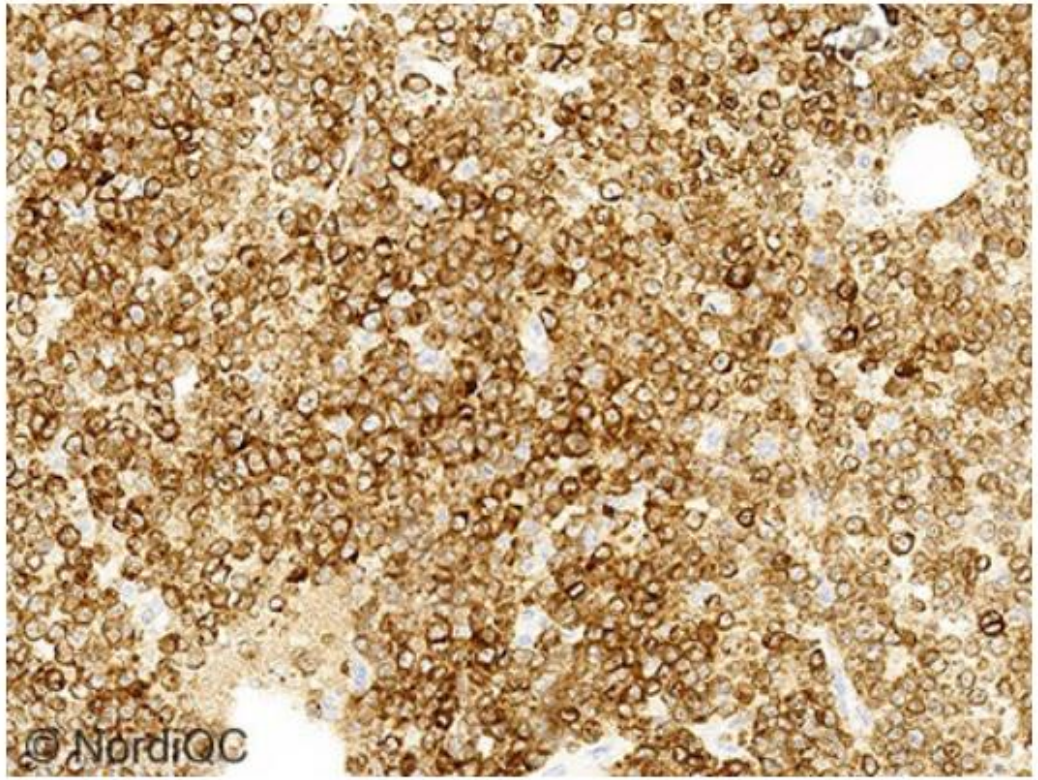

Fig. 8b
Optimal MLA staining of the malignant melanoma tissue core no. 4 (low-level expressor) using **rmAb EP43** in similar protocol settings as in Fig. 8a (and 7a and 7b) All neoplastic cells show a moderate to strong cytoplasmic staining reaction. In melanomas, rmAb EP43 produce very strong reactions. Compare with mAb A103 in Fig. 8a – same field.

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**Melan A /MART1**

| Melanoma (Lymph node) |  |  |  |
| Adrenal gland |  |  |  |

**TRS High pH/Flex+ protocols**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Optimization of the IHC assay – issues to be addressed

- Purpose and/or “fit-for-purpose” of the IHC test
- How to establish “best practice protocol” of the IHC test (Calibration of the IHC assay with focus clone, antigen retrieval, titer & detection system)
- How to validate (technical) the IHC-test
  - Is the IHC test reproducible/robust (preanalytic conditions)
  - Evaluation of the analytical sensitivity and specificity
- Identification of robust controls providing information of each test performance in daily practice.

Tissue materials are essential for these processes (calibration, validation and controls)

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## How to establish "best practice protocol" of the IHC test - parameters to consider

Use a "Test battery approach" (pre-treatment and dilution range)

Test more than one antibody clone against an antigen of interest before implementation in the routine

Test with robust, specific & sensitive detection system

Test/validate on normal and tumor tissue material with broad spectrum of antigen densities (specificity/sensitivity)

Compare results with external quality assurance programs, literature or colleagues

No antibody should be acquired without the basic knowledge of its performance characteristics and expected expression pattern

Hadi Yaziji and Todd Barry – Adv Anat Pathol • Vol13, Number 5, September 2006

Recommendations for Improved Standardization of Immunohistochemistry

*Neal S. Goldstein, MD, Stephen M. Hewitt, MD, PhD, Clive R. Taylor, MD, DPhil, Hadi Yaziji, MD, David G. Hicks, MD, and Members of Ad-Hoc Committee On Immunohistochemistry Standardization*

**Abstract:** Immunohistochemistry (IHC) continues to suffer from variable consistency, poor reproducibility, quality assurance disparities, and the lack of standardization resulting in poor concordance, validation, and verification. This document lists the recommendations made by the Ad-Hoc Committee on Immunohistochemistry Standardization to address these deficiencies. Contributing factors were established to be under-fixation and irregular fixation, use of nonformalin fixatives and ancillary fixation procedures divested from a deep and full understanding of the IHC assay parameters, minimal or absent IHC assay optimization and validation procedures, and lack of a standard system of interpretation and reporting. Definitions and detailed guidelines pertaining to these areas are provided.

**Key Words:** immunohistochemistry, pathology, assay, oncology, standardization, procedure, tissue, fixation

(*Appl Immunohistochem Mol Morphol* 2007;15:124–133)

IHC assay standardization was vital for reproducible and reliable results. Agencies, including the Biologic Stain Commission, CLSI (previously NACCLS), FDA, and the manufacturing sector established guidelines, s and recommendations for reagents and packag These efforts have resulted in consistent, hig assay components and instruments on which co ary IHC is performed.[1–4] It has also allo development and use of so-called black box IH in which IHC assays have preset parameters s manufacturer.[5]

Despite the improvements of reagents and tion, authors over the years have consistently inconsistent quality of IHC assays.[6–11] Unlike IHC-epochs, most of the causative responsib with the individual laboratory performing the specifically, the lack of standardization and att quality assurance programs.[12,13] Prior consensu ences identified the likely causative factors (T

ANNUAL REVIEW ISSUE

# Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

**Main causes of insufficient staining reactions are related to:**

- The choice of antigen retrieval method
- The choice of primary antibody (Concentrate or RTU)
  a) Calibration of the antibody dilutions
  b) Stainer platform dependent antibodies
- The choice of detection system

**83 % of insufficient results**

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

**89 markers assessed during the period 2003-2015 and several markers have been assessed several times. Seven runs for HER2 ISH (more than 30000 slides assessed)**

ANNUAL REVIEW ISSUE

# Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

## Problems related to the choice of antigen retrieval method :

- Using non-alkaline HIER buffer (low pH buffer)
- Using inefficient / too short HIER period
- Using no or enzymatic pre-treatment instead of HIER
- Using excessive retrieval procedure → impaired morphology

**False positive or false negative results**

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5. Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

**27% insuff.**

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

**The purpose of antigen retrieval is to unmask antigen epitopes /restore antigenic determinants and recover immuno-reactivity**

ORIGINAL ARTICLE

# Detection of smoothelin expression in the urinary bladder is strongly dependent on pretreatment conditions: a critical analysis with possible consequences for cancer staging

Claes Lindh · Robert Nilsson · Marie Louise Lindstrom · Lilian Lundin · Goran Elmberger

**Distinguishing urinary bladder muscularis propria (MP) from muscularis mucosae (MM) is crucial in bladder cancer staging.**

**Table 1** Intensity of smoothelin IHC staining depending on pretreatment conditions

| Intensity | | Muscularis mucosae (%) | | Muscularis propria (%) |
|---|---|---|---|---|
| Enzymatic pretreatment | | | | |
| Negative | 0 | 17/18 (94) | Negative | 14/18 (78) |
| Weak | 2+ | 1/18 (6) | | 4/18 (22) |
| | 3+ | 0/18 (0) | | 0/18 (0) |
| Strong | 4+ | 0/18 (0) | | 0/18 (0) |
| HIER in acidic buffer | | | | |
| Negative | 0 | 10/18 (56) | Intermediate | 1/18 (5.5) |
| Weak | 1+ | 7/18 (39) | | 10/18 (56) |
| | 2+ | 1/18 (5) | | 6/18 (33) |
| Strong | 3+ | 0/18 (0) | | 1/18 (5.5) |
| HIER in alkaline buffer | | | | |
| Negative | 0 | 1/18 (6) | Positive | 0/18 (0) |
| Weak | 1+ | 6/18 (33) | | 0/18 (0) |
| | 2+ | 7/18 (39) | | 1/18 (6) |
| Strong | 3+ | 4/18 (22) | | 17/18 (94) |

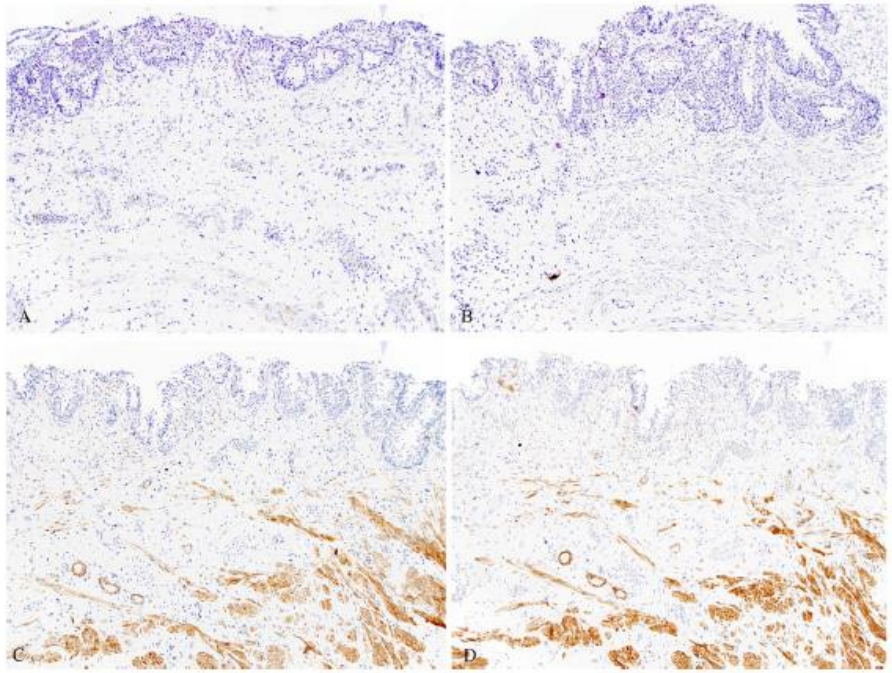

**Fig. 1** Staining intensity of the muscularis mucosae, muscularis propria and smooth muscle in blood vessels depended strongly on pretreatment conditions. Staining without pretreatment resulted in weak staining of smooth muscle in the blood vessels (**a**) while staining was virtually absent when using enzymatic pretreatment (**b**). HIER in acidic buffer resulted in weak–moderate staining (**c**), but the strongest staining was achieved using HIER in alkaline buffer as pretreatment (**d**) (a–d lens magnification ×10)

**The discrepancy between different studies using the same primary antibody for smoothelin in the bladder is properly caused by different technical aspects**

**Table 2** Summary of IHC protocols used by different groups

| | Antibody | Dilution | HIER | Platform |
|---|---|---|---|---|
| Paner et al. | R4A (Abcam Inc.) | 1:150 | Citrate buffer (acidic, pH 6.0) | Ventana Benchmark System |
| Council et al. | R4A (Chemicon International) | 1:400 | Citrate buffer (acidic) | Ventana Benchmark System |
| Miyamoto et al. | R4A (Abcam Inc.) | 1:200 | Mild CC1 buffer (high pH) | Ventana Benchmark System |
| Lindh et al. | R4A (Biocare Medical) | 1:100 | EDTA (alkaline, pH 9.0) | Bond Max |

**In conclusion, smoothelin IHC is strongly dependent on the chosen epitope retrieval method, and smoothelin staining did not discriminate reliably between MP and MM with any of the tested pretreatment protocols.**

| **Ordering Code:** | 06586554001 |
| **Quantity:** | 50 tests |
| **Controls:** | Medullary Carcinoma of Thyroid |
| **Isotypes:** | IgG |
| **Clone Name:** | SP17 |
| **Species:** | Rabbit |
| **Localization:** | Cytoplasmic |
| **Regulatory Status:** | IVD |

This antibody is intended for in vitro diagnostic (IVD) use. Calcitonin (SP17) antibody is intended for qualified laboratories to qualitatively identify by light microscopy the presence of associated antigens in sections of formalin-fixed, para test methods. This antibody is used as an aid in the id diagnosis of thyroid medullary carcinoma within the c clinical history, and other diagnostic tests determined

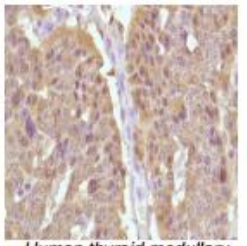
SPRING BIOSCIENCE

## Rabbit Anti-Human Calcitonin Monoclonal Antibody (Clone SP17)

| Spring Cat# | Roche P/N | Product Description |
|---|---|---|
| M3170 | 05492769001 | 0.1 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide. |
| M3172 | 06970419001 | 0.5 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide. |
| M3174 | 05298725001 | 1.0 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide. |
| M3171 | 05298717001 | 7.0 ml pre-diluted rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.6 with less than 0.1% sodium azide. (For manual IHC only) |



*Human thyroid medullary carcinoma stained with anti-calcitonin antibody*

| | |
|---|---|
| **INTENDED USE:** | For Research Use Only. Not for use in diagnostic procedures. |
| **CLONE:** | SP17 |
| **IMMUNOGEN:** | Synthetic human calcitonin 1-32 amino acid peptide. |
| **IG ISOTYPE:** | Rabbbit IgG |
| **EPITOPE:** | Not determined |
| **MOLECULAR WEIGHT** | 15kDa |
| **SPECIES REACTIVITY:** | Human (tested). (See www.springbio.com for information on species reactivity predicted by sequence homology.) |
| **DESCRIPTION:** | Calcitonin is a 32 amino acid peptide which can be demonstrated in C cells of the normal and hyperplastic thyroid. Staining for calcitonin may be used for the identification of a spectrum of C cell proliferative abnormalities ranging from C cell hyperplasia to invasive tumors. Staining for calcitonin in medullary carcinoma of the thyroid produces a fine granular pattern in the cytoplasm. Amyloid deposits within the tumor may also exhibit varying degrees of calcitonin activity. |
| **APPLICATIONS:** | Immunohistochemistry (IHC) |
| **IHC PROCEDURE:** | **Specimen Preparation:** Formalin-fixed, paraffin-embedded tissues are suitable for use with this primary antibody.<br>**Deparaffinization:** Deparaffinize slides using xylene or xylene alternative and graded alcohols.<br>**Antibody Dilution:** If using the concentrate format of this product, dilute the antibody 1:100 in Antibody Diluent (Cat# ADS-125). The dilutions are estimates; actual results may differ because of variability in methods and protocols.<br>**Antigen Retrieval:** None<br>**Primary Antibody Incubation:** Incubate for 30 minutes at room temperature.<br>**Slide Washing:** Slides must be washed in between steps. Rinse slides with PBS/0.05% Tween.<br>**Detection:** Detect the antibody as instructed by the instructions provided with the detection system. |
| **POSITIVE CONTROL:** | Thyroid medullary carcinoma |
| **CELLULAR LOCALIZATION:** | Cytoplasm |

Can we use the recommendations provided by the manufactures spec sheets?

# Calcitonin optimization (data sheets ?)

Omnis, Flex+

## Antigen Retrieval in Formalin-fixed, Paraffin-embedded Tissues: An Enhancement Method for Immunohistochemical Staining Based on Microwave Oven Heating of Tissue Sections

SHAN-RONG SHI, MARC E. KEY,[1] and KRISHAN L. KALRA
*BioGenex Laborat*

Received for publi

We describe a ne
formalin-fixed, p

**Shi et al. demonstrated that :**

- **Enzyme pre-digestion of tissue could be omitted.**
- **Incubation time with primary antibodies could be reduced, or dilutions of primary antibodies could be increased.**
- **Staining could be achieved on long-term formalin fixed that failed to stain with conventional methods.**
- **Certain antibodies which where typically unreactive with formalin-fixed tissue gave excellent staining.**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**Several hypothesis in regard of the mechanism of HIER has been proposed, but the mechanism of action of HIER is not completely understood.**

**Heating tissue sections in an appropriate buffer may unmask epitopes by :**

- ❑ **Hydrolysis/disruption of methylene cross-links formed by formalin fixation**
- ❑ **Extraction of diffusible blocking proteins**
- ❑ **Precipitation of proteins**
- ❑ **Rehydration of the tissue section allowing better penetration of the antibody**
- ❑ **Removal of tissue-bound calcium ions by chelating substances**
- ❑ **Other mechanism´s ?**

**Reviewed by Ramos-Vara JA: Vet Pathol 42:405-426, 2005**

ORIGINAL PAPER

# Hypothesis for the mechanism for heat-induced antigen retrieval occurring on fresh frozen sections without formalin-fixation in immunohistochemistry

Kochi Kakimoto · Susumu Takekoshi · Katsuhiro Miyajima · R. Yoshiyuki Osamura

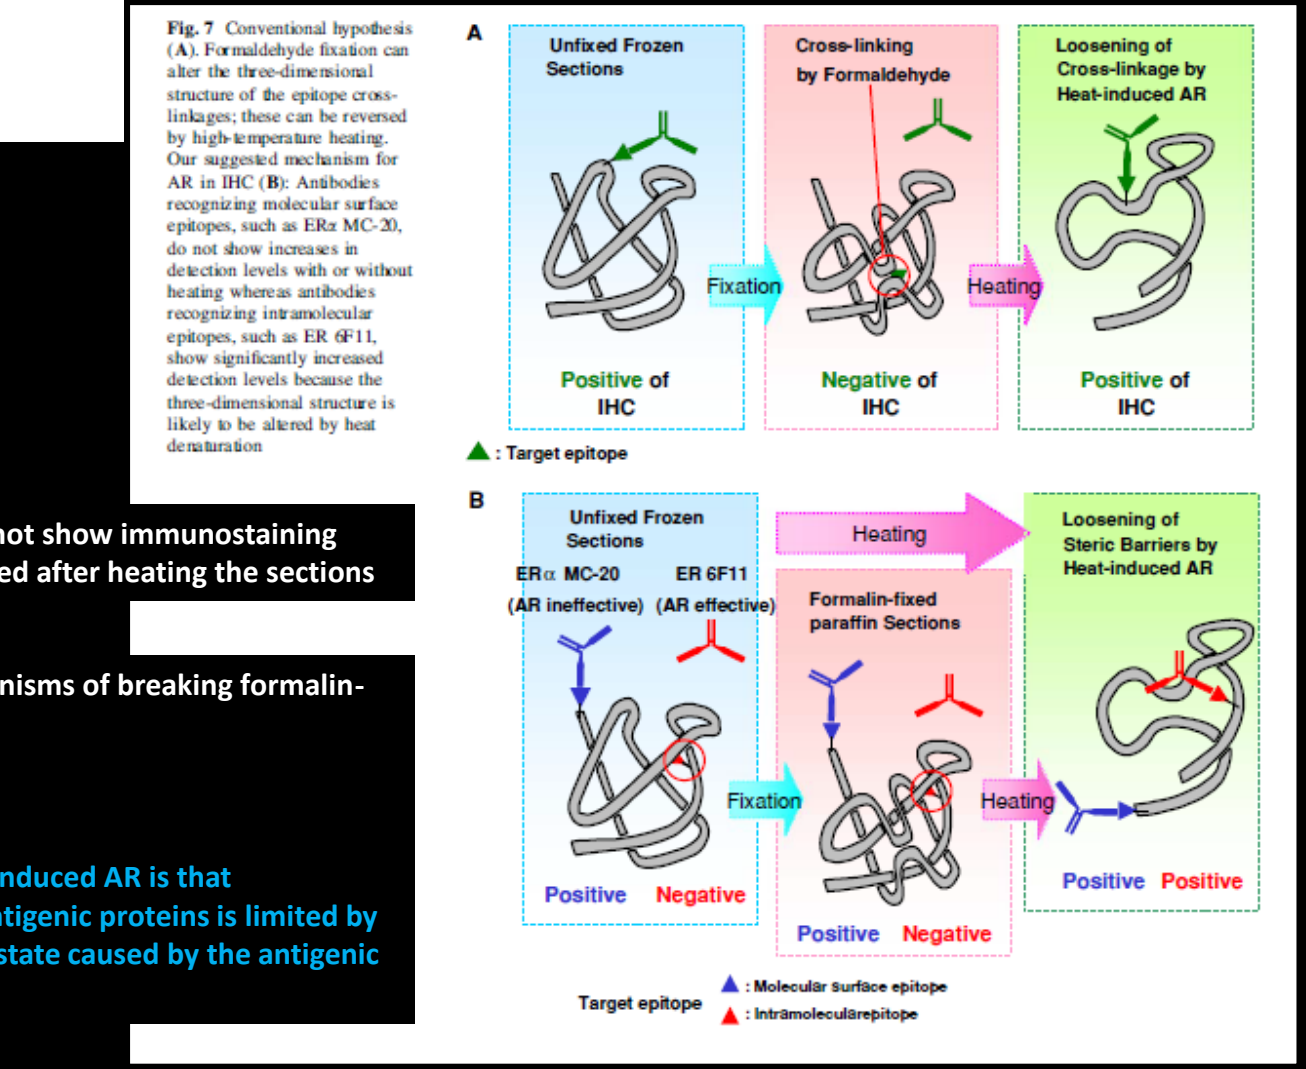

Fig. 7 Conventional hypothesis (A). Formaldehyde fixation can alter the three-dimensional structure of the epitope cross-linkages; these can be reversed by high-temperature heating. Our suggested mechanism for AR in IHC (B): Antibodies recognizing molecular surface epitopes, such as ERα MC-20, do not show increases in detection levels with or without heating whereas antibodies recognizing intramolecular epitopes, such as ER 6F11, show significantly increased detection levels because the three-dimensional structure is likely to be altered by heat denaturation

**The unfixed frozen sections, which did not show immunostaining with nine antibodies, were clearly stained after heating the sections**

**These results indicate that other mechanisms of breaking formalin-induced cross-linkages may be present.**

**The authors proposed that :**

**One of the other mechanisms for heat-induced AR is that accessibility to the target epitopes of antigenic proteins is limited by natural steric barriers even in the fresh state caused by the antigenic protein itself.**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Efficient HIER depends on:

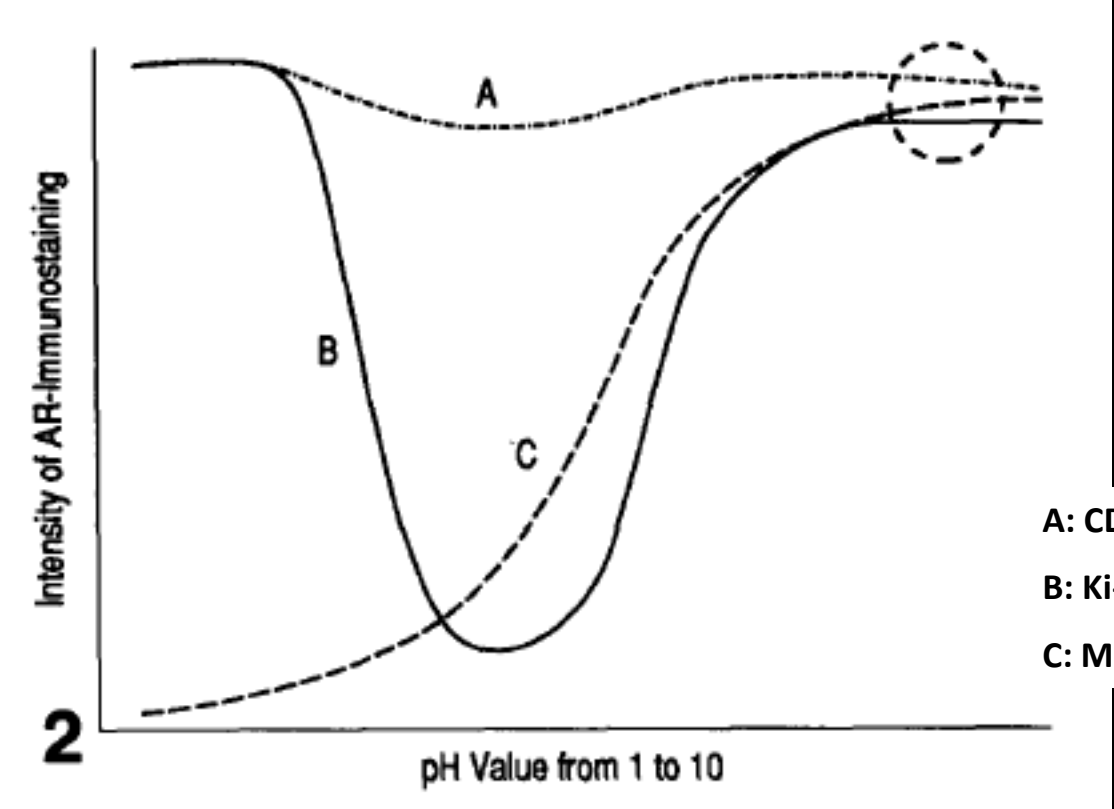
- ❑ pH of the HIER buffer
- ❑ Temperature
- ❑ Time
- ❑ Elementary nature of the HIER buffer (e.g. Citrate; TRIS; EDTA; TE)
- ❑ "Fixation time in formalin"

Less sensitive to routinely fixed tissue (formalin) compared to enzymatic pre-treatment

> 95% of all commonly used antibodies require HIER

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Shi SR et al. *J Histochem Cytochem 1995 43:193-201*



## Efficient HIER - Influence of pH

**A: CD20 (clone L26)**

**B: Ki-67 (clone MIB1)**

**C: MSA (clone HMB45)**

**Demonstrated that the performance of monoclonal antibodies were highly influenced by pH of the Antigen Retrieval buffer (AR).**

**Also, the results indicate the advantage of using an AR solution of higher pH value (8-9).**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**The purpose of antigen retrieval is to unmask antigen epitopes /restore antigenic determinants and recover immuno-reactivity**

**Antigen retrieval procedures for formalin fixed tissue:**

- ❑ **Heat Induced Epitope Retrieval (HIER)**
- ❑ **Tissue digestion using proteolytic enzymes**
- ❑ Combined pre-treatment (HIER with proteolytic digestion)

**Proteolytic enzymes cleave more or less specific amino acid sequences within peptide chains and not covalent cross-links formed in tissues during formalin fixation.**

**→ Improves penetration of reagents into the tissue structures and restore the immunodominant conformation of epitopes of interest.**

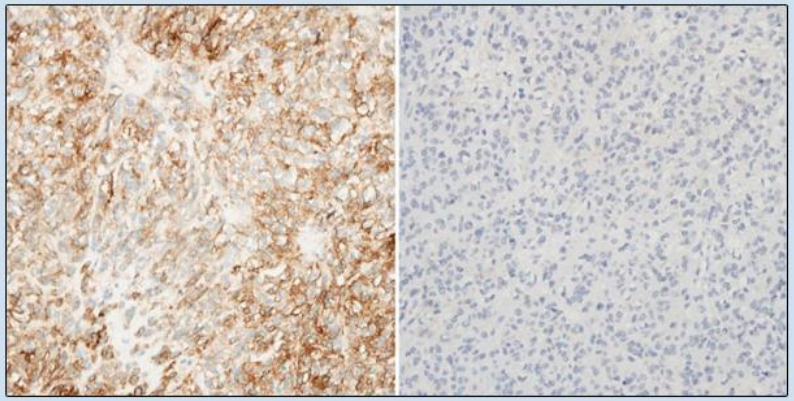
## Results general module - run 47



Runs 47 was accomplished April to July 2016. A very short summary of the tests is given below. Click on the epitope name to see the complete general assessment results for each marker, including recommended clones and protocols, and major causes of insufficient staining results. Individual results will be sent to participant by email.

*Figure: Serial sections of GIST stained for CD117 in two labs. Left: optimal, right: false negative due to an insufficient protocol.*

CK20: 284 participants, 92% sufficient, 62% optimal. Efficient HIER is recommended, proteolytic pretreatment generally gives a lower pass rate.

CK-PAN: 275 participants, 72% achieved a sufficient mark, 48% optimal. For Ab cocktails containing AE1/AE3 HIER is mandatory. mAb MNF116 requires proteolytic pretreatment but the clone performs less well than AE1/AE3.

| mAb clone Ks20.8 * | Sufficient result | Optimal result |
|---|---|---|
| HIER in Alkaline buffer | 92% (91 of 99) | 47% |
| Enzymatic pre-treatment | 75% (9 of 12) | 25% |

***As concentrate: App. 10 % of the protocols (12 of 126) were based on enzymatic pre-treatment**

Table 4. **Pass rates for antibody cocktails combined with epitope retrieval methods in seven NordiQC runs**

| | Pass rate for run 15, 20, 24, 30, 36, 41 & 47 | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Total | | HIER | | Proteolysis | | HIER + proteolysis | |
| | Protocols | Sufficient | Protocols | Sufficient | Protocols | Sufficient | Protocols | Sufficient |
| **mAb AE1/AE3** | 752 | 542 (72%) | 693 | 535 (77%) | 44 | 5 (11%) | 5 | 2 (40%) |
| **mAb AE1/AE3/5D3** | 37 | 34 (92%) | 36 | 34 (94%) | 1 | 0 | 0 | 0 |
| **mAb AE1/AE3/PCK26** | 176 | 105 (60%) | 25 | 13 (48%) | 34 | 0 | 117 | 92 (79%) |
| **mAb MNF116** | 91 | 30 (33%) | 40 | 9 (23%) | 47 | 21 (45%) | 4 | 2 (50%) |

**AE1/AE3: App. 6 % of all protocols (44 of 742) were based on enzymatic pre-treatment (seven NQC Runs).**

## Problem

**A significant proportion of Labs still uses enzymatic digestion for a "wide" range of markers "requiring" HIER for optimal performance**

**Only few markers require enzymatic digestion as the solitary pre-treatment procedure for routine purpose**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## ”Optimal” enzymatic digestion depends on:

Enzyme type

Concentration

Time

Temperature

Fixation type & time

Tissue type

**Most common Enzymes**

Proteinase K
Pronase XIV
Pronase XXIV
Pepsin
Trypsin

**Difficult to control and to standardizes within routine LAB**

Short time formalin fixation = gentle proteolysis
Long time formalin fixation = prolonged proteolysis

**Markers requiring enzymatic pretreatment :**

FVIII (poly), LMV CK (CAM 5.2), PAN CK (MNF116), EGFR (various), TCR-β (8A3)……..

Extracellulare matrix proteins (COLL-III (poly), Laminin (poly) and COLL-IV (CIV-22) ……..

≤ 2% of all commonly used antibodies require enzymatic (or no) pre-treatment

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

| Enzyme | Typical working conc. | Activation Temperature | Typical Incubation time | Cleavage nature |
|---|---|---|---|---|
| Proteinase K | 0.1%, pH 8.0 | 25-37 °C | 5-10 min. | Broad, all amino acids |
| Trypsin | 0.1-0.25%, pH 7.6 | 37 °C | 10 min. | Arginin / Lysin |
| Pepsin | 0.2-0.4%, pH 2.0 | 37 °C | 5-20min. | Broad ,favor peptides with aromatic amino-groups |
| Protease XXIV | 0.05-0.1%, pH 7.6 | 37 °C | 5-10 min. | Broad, all amino acids |
| Protease XIV | 0.05-0.1%, pH 7.6 | 25-37 °C | 10-30min. | Broad, favor peptides with aromatic residues |

**Markers requiring enzymatic pretreatment :**

FVIII (poly), LMV CK (CAM 5.2), PAN CK (MNF116), EGFR (various), TCR-β (8A3)……..

Extracellulare matrix proteins (COLL-III (poly), Laminin (poly) and COLL-IV (CIV-22) ……..

# Choice of proteolytic enzyme

ANNUAL REVIEW ISSUE

# Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg [1,2] · Søren Nielsen [1]

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

## Problems related to the choice of antigen retrieval method :

- Using non-alkaline HIER buffer (low pH buffer)
- Using inefficient / too short HIER period
- Using no or enzymatic pre-treatment instead of HIER
- **Using excessive retrieval procedure → impaired morphology**

**False positive or false negative results**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**Proteolytic pretreatment (excessive retrieval procedures)**

- over digestion (e.g. not calibrated to the fixation time in NBF)

**HIER (excessive retrieval procedures)**

- too high temperature for too long time especially in alkaline retrieval buffers

**HIER applying standard procedures (excessive retrieval procedures)**

- fragile tissue/cell material (cell clot´s )

# BoneSTATION
# Advanced system for fixation and decalcification of bone tissues

A new and innovative workstation for complete control of the all important pre-analytical step.
Provides accurate, reliable diagnostic results for morphology and molecular studies.
The BoneSTATION consists of two work platforms complete with glass modules for fixation/ decalcification.

The front platform (for the decalcification step) features a heating plate with infrared sensors for automatic temperature control up to 50°C and magnetic stirring. The rear platform (for the fixation step) has built-in magnetic stirring only.

Two user-friendly work platforms, for easy handling of bone specimens, complete the unit. The BoneSTATION station can be used with ANY type of fixative/decalcifier, even with strong mineral acids (HCl - HNO3), as all contact surfaces are either glass or PTFE polymer. The magnetic stirrer assures homogeneity of temperature throughout the solution.
The PTFE cover condenses vapors, generating a reflux of the reagent for consistent and safe protocols at constant pH.
A touch-screen terminal allows the user to optimize, standardize and fully document all the processes.

**At arrival in our department - New fixative is added and post fixation for 24h of the bone marrow material has improved morphology.**

**However, the pre-analytic conditions is suboptimal but difficult to change in our hospital**

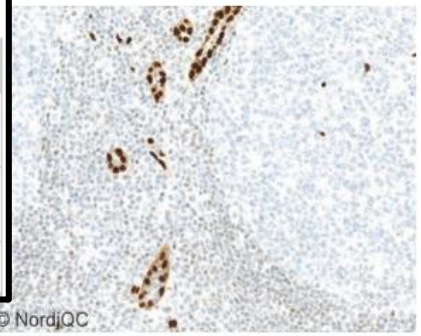

Fig. 1a
Optimal staining for ERG of tonsil using the rmAb clone EP111 within a laboratory developed assay optimally calibrated, using HIER in an alkaline buffer and a 3-step multimer based detection system, OptiView Ventana. Virtually all endothelial cells show a strong nuclear staining reaction, while mantle zone B-cells and interfollicular lymphocytes show a weak but distinct nuclear staining reaction. .
Also compare with Figs. 2a – 4a, same protocol.

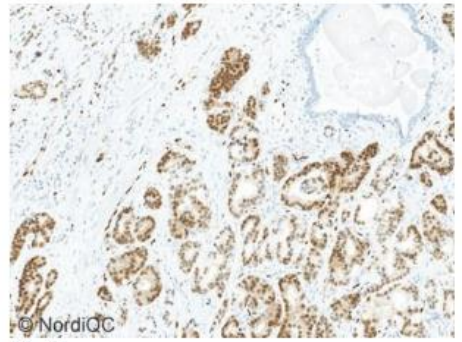

Fig. 3a
Optimal ERG staining of the prostate adenocarcinoma, tissue core no. 5, using same protocol as in Figs. 1a and 2a.
A moderate to strong and distinct nuclear staining reaction is seen in virtually all neoplastic cells. A weak cytoplasmic staining reaction is seen, but in general, a high signal-to-noise ratio is observed.

**ERG, 9FY, prostate adenocarcinoma TMPRSS2-ERG gene fusion ?**

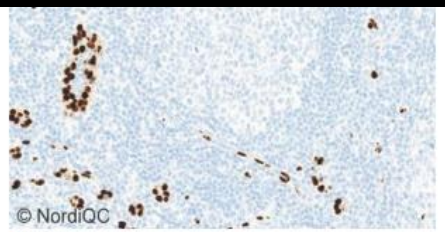

Fig. 5a
Staining for ERG of tonsil using the mAb clone 9FY within a laboratory developed test using HIER in an alkaline buffer and a 3-step polymer based detection system.
This antibody does not react with lymphocytes, whereas an intense nuclear staining reaction in endothelial cells is seen.
However despite this intense staining reaction an insufficient result in the prostate adenocarcinomas was seen – see also Fig. 5b, same protocol.
14 of 15 protocols based on mAb clone 9FY provided an insufficient result and only one sufficient result assessed as good.

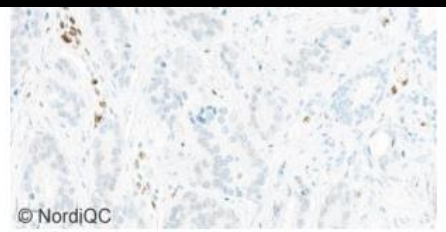

Fig. 5b
Insufficient ERG staining of prostate adenocarcinoma, tissue core no. 5 with high level ERG expression  using same protocol as in Fig. 5a.
Only the endothelial cells show a distinct nuclear staining reaction, while virtually all the neoplastic cells are negative.
Compare with Fig. 3a showing the level expected.

⊕ Author information

**Abstract**

SPOP mutations and TMPRSS2-ERG rearrangements occur collectively in up to 65% of human prostate cancers. Although the two events are mutually exclusive, it is unclear whether they are functionally interrelated. Here, we demonstrate that SPOP, functioning as an E3 ubiquitin ligase substrate-binding protein, promotes ubiquitination and proteasome degradation of wild-type ERG by recognizing a degron motif at the N terminus of ERG. Prostate cancer-associated SPOP mutations abrogate the SPOP-mediated degradation function on the ERG oncoprotein. Conversely, the majority of TMPRSS2-ERG fusions encode N-terminal-truncated ERG proteins that are resistant to the SPOP-mediated degradation because of degron impairment. Our findings reveal degradation r uncharacterized mechanism that contributes to elevation of truncated ERG proteins in p suggest that overcoming ERG resistance to SPOP-mediated degradation represents a v prostate cancers expressing either mutated SPOP or truncated ERG.

**Detection of ERG using clone 9FY in prostate adenocarcinomas ? - antibody raised against the N-terminal part of the ERG (wt) protein.**

Pathol Res Pract. 2014 Aug;210(8):508-13. doi: 10.1016/j.prp.2014.04.005. Epub 2014 Apr 18.

## Immunoreactivity using anti-ERG monoclonal antibodies in sarcomas is influenced by clone selection.

Machado I[1], Mayordomo-Aranda E[2], Scotlandi K[3], Picci P[3], Llombart-Bosch A[4].

⊕ Author information

**Abstract**

The aim of the present study was to explore ERG immunoreactivity in a series of sarcomas, GIST and malignant rhabdoid tumor (MRT), considering the not fully elucidated specificity and sensitivity of this antibody. Paraffin-embedded tissue microarrays from those tumors were stained with anti-ERG against the C-terminus [(EPR3864(2)] and N-terminus (Clone 9FY). EPR3864(2) was positive in almost all angiosarcomas, and MRT.GIST were positive in a large proportion of cases (38.4%), and more than half the synovial sarcomas (52.7%) revealed EPR3864(2) staining. Several chondrosarcomas, osteosarcomas, rhabdomyosarcoma and Ewing's sarcoma family of tumors (ESFT) presented EPR3864(2) expression in a lower number of cases. 9FY was positive in most of the angiosarcomas; however, only sporadic ESFT and synovial sarcoma were positive and the other tumors tested were negative. Fourteen ESFT with EWSR1/Fli-1 gene fusion presented positive nuclear staining for EPR3864(2). Similarly, 5 ESFT with EWSR1/Fli-1 gene fusion presented positive staining for 9FY. We must stress that the difference between the present and previous studies may be due to the source of the anti-ERG employed, anti-ERG against C or N-terminus, protein cross-reactivity and dilution. In conclusion, specificity for ERG staining in sarcomas should be considered with caution and the immunoexpression is undoubtedly influenced by clone and antibody selection.

**Conclusion**
Optimal staining results could be obtained with the mAb clone **MRQ-50**, the rmAb clones **EP298**, **SP348** and **ZR-1** and the pAbs **10336-1-AP** and **363A-17/18**. Irrespective of the clone applied, efficient HIER, use of a sensitive 3-step polymer/multimer based detection system and careful calibration of the primary antibody were the most important prerequisites for an optimal staining result.
The rmAbs clones **EP298**, **SP348** and **ZR-1** gave encouraging results and a high proportion of sufficient results on the main fully automated platforms where no cross-reaction with e.g. PAX5 was observed. In contrast, the mAb clone **MRQ-50** provided a poor performance especially on the Ventana BenchMark and Dako Omnis platforms and at the same time also labelled PAX5 in B-cells. In coming assessments cross-reaction with other PAX epitopes will be downgraded.

**BC12 (platform dependent)**

**"ZR1" (lot variations/antibody diluent dependent)**

**EP298**

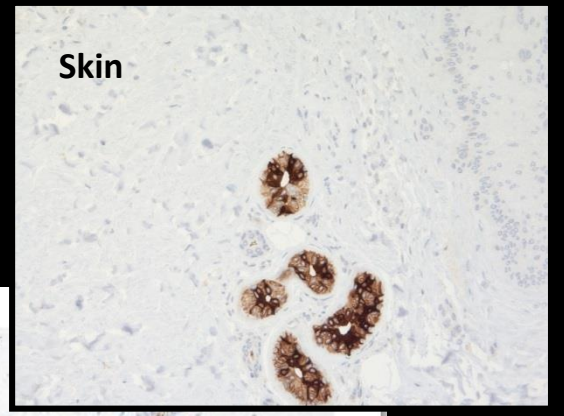
**SP348**

**Cross react with other Pax proteins in the family (e.g. PAX5):**

**Should we use primary antibodies that cross react with other proteins in the same family ?**

**Would we accept cross-reactivity in the family of CD`s and CK`s - e.g. CD20 to CD3 or CK5 to CK8 ?**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase



## Problem: Primary antibody poorly calibrated providing low sensitivity

The right primary antibody

The right protocol (AR procedure and detection system)

Poorly calibrated primary Ab ?

### Tissue controls are the key element

Normal skin is the preferred positive control for GCDFP-15. The epithelial cells of the eccrine sweat glands must show an as strong as possible positive cytoplasmic staining reaction, while all other cells should be negative.

Normal breast tissue can also be used as control in which epithelial cells of the ductal glands must show an as strong as possible staining reaction.

Background staining may be seen in vicinity of highly positive tissue structures (e.g. eccrine sweat glands)

**Gross cystic disease fluid protein-15 (GCDFP-15)**

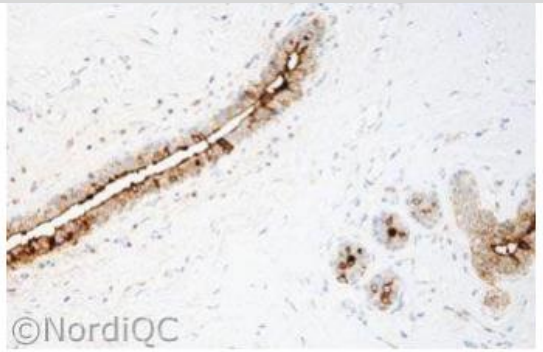


Fig. 1a
Optimal staining for GCDFP-15 of the breast hyperplasia using the mAb clone 23A3 optimally calibrated as a concentrate, HIER in an alkaline buffer and a polymer based detection system. The majority of the ductal epithelia cells show a distinct moderate to strong cytoplasmic staining reaction. Also compare with Fig. 2a – same protocol.

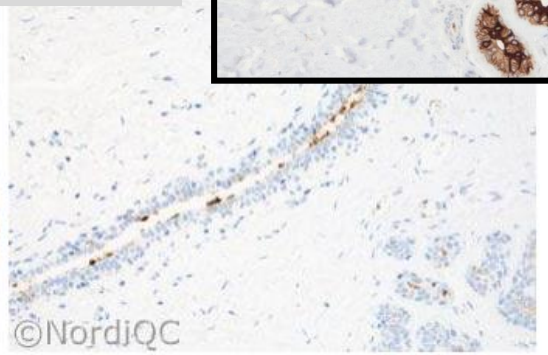

Fig. 1b
Insufficient staining for GCDFP-15 of the breast hyperplasia applying the mAb clone 23A3 as a concentrate using exactly the same protocol settings as used in Fig 1a, except for a 20 fold dilution of the primary antibody. The proportion and the intensity of the cells demonstrated are significantly reduced compared to the result in Fig. 1a. Also compare with Fig. 2b – same protocol.

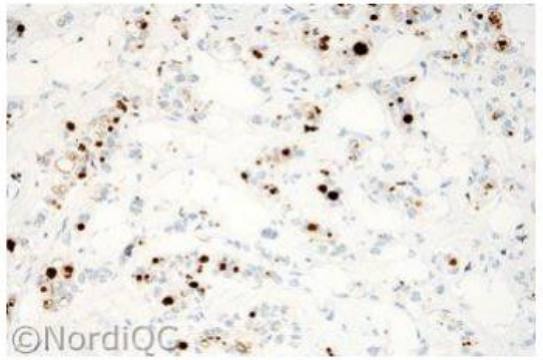

Fig. 2a
Optimal staining for GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1a.
The majority of the neoplastic cells show a moderate to strong dot-like cytoplasmic staining reaction.

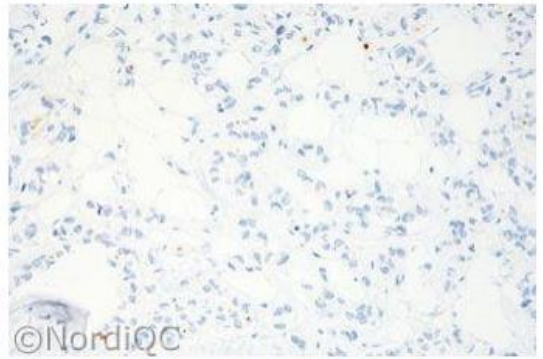

Fig. 2b
Insufficient staining GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1b. - same field as in Fig. 2a.
Only scattered neoplastic cells show a faint dot-like reaction.

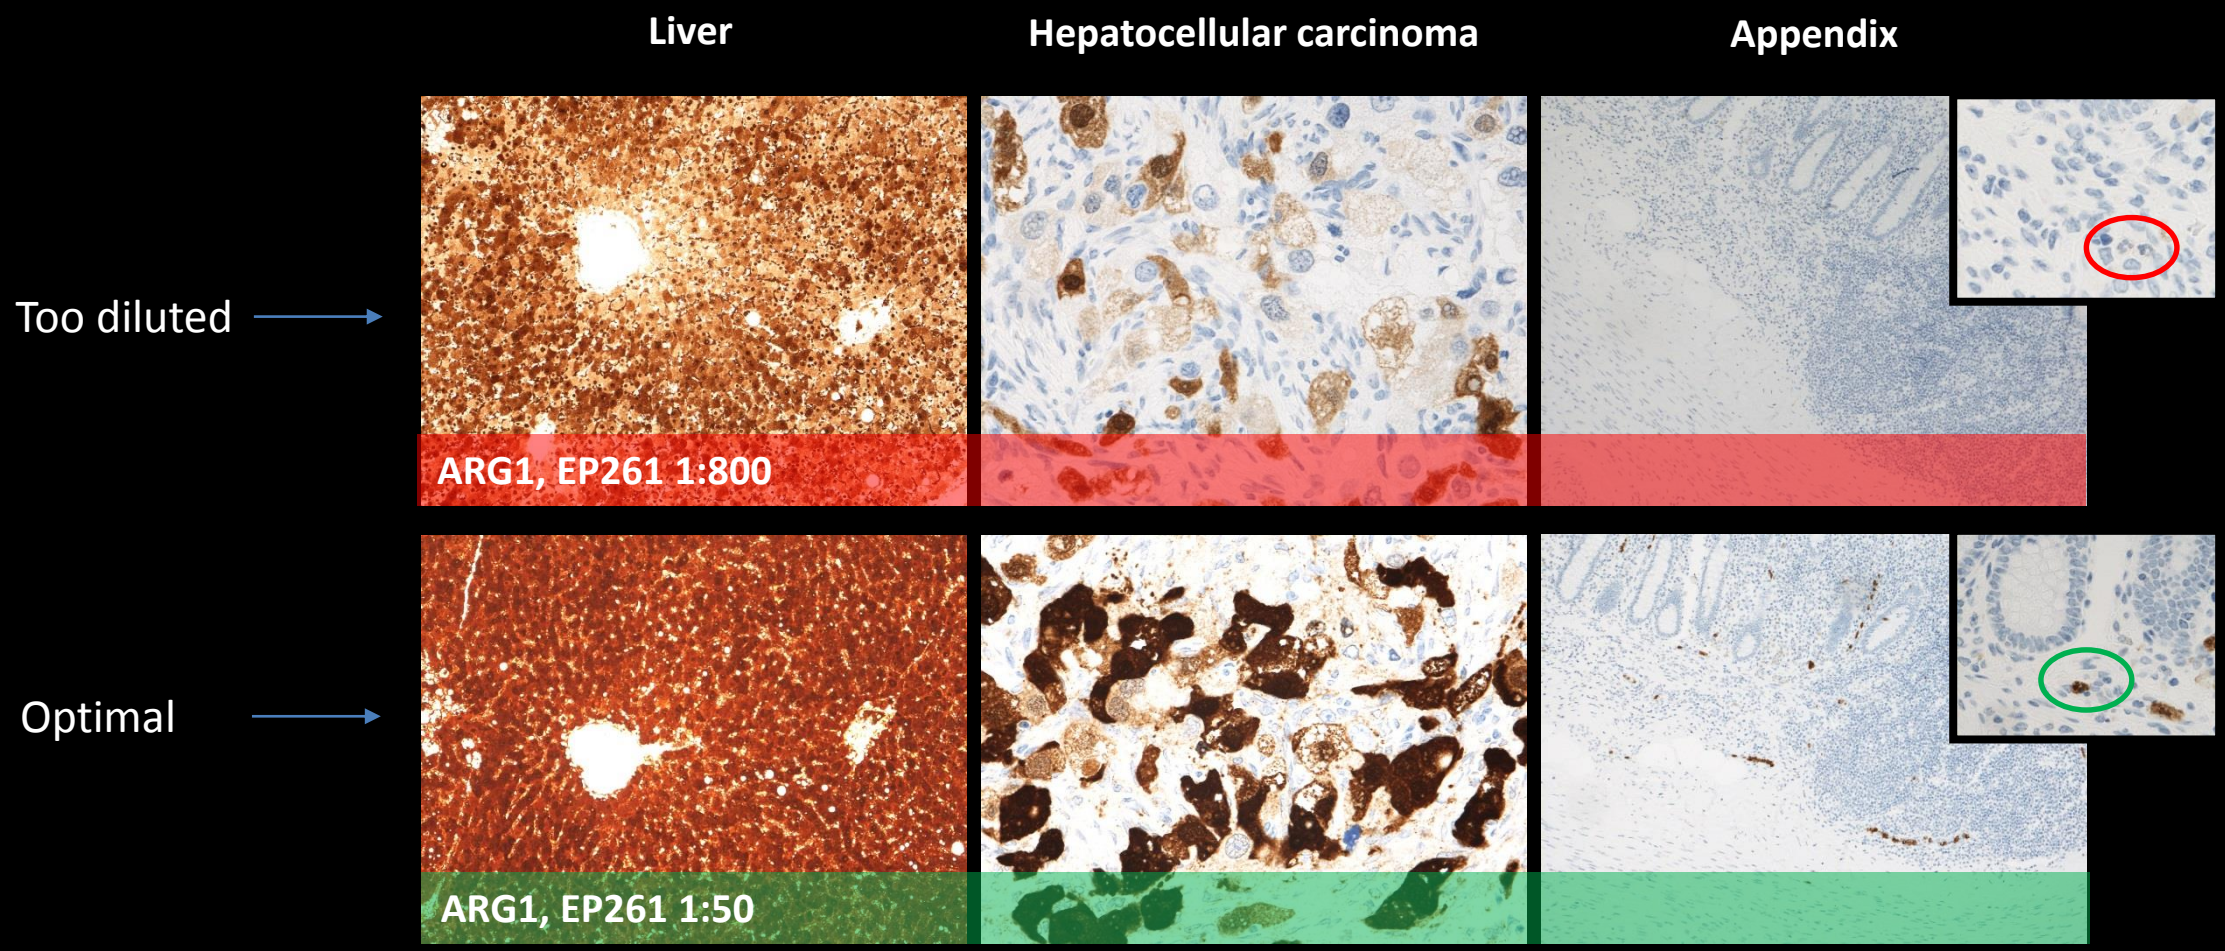
High pH 24`, Flex+Rabbit

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Problem: Primary antibody poorly calibrated providing low sensitivity



HIER High pH 24`; Flex+ Rabbit linker

In collaboration with Ole Nielsen, Department of Pathology, Odense

# IHC: Technical considerations to intended use and “fit-for-purpose” approach

Do we have the right antibody (IHC type markers 1 & 2) – can it provide appropriate sensitivity and specificity

Does the antibody work on the chosen automatic platform(s)

Does the automatic platform come with appropriate reagents fulfilling purpose and intended use of the IHC assay

- Appropriate Antigen Retrieval solutions (enzymes and HIER buffers)
- Appropriate antibody diluents and wash buffers
- Appropriate detection and visualization products
- Appropriate protocol library

Do we have access to appropriate tissue, reflecting the range of different antigen expression levels, both for the optimization process but also for the laboratory`s internal quality assurance program (control tissue) – monitoring specificity and sensitivity of the assays

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

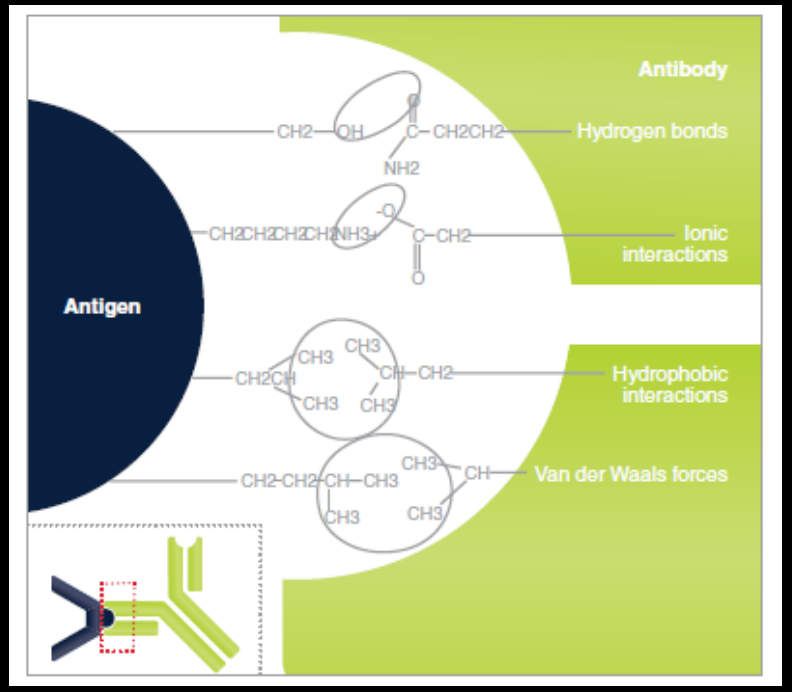
## Antibody-Antigen reaction – Antibody Diluents



Antibodies are attracted initially through electrostatic interactions, and subsequently through weak forces

- Hydrogen bonds
- Hydrophobic interactions
- Van der Waals forces

### Antibody diluents

Commercial antibody diluents are buffered solutions

- often based on TRIS-HCL buffers at neutral pH (7.0-7.6)
- often contains detergent, NaCl and stabilizers
- may contain protein-based background reducing agents
  - BSA
  - Serum proteins
  - Caseins

Protein blockers act by occupying the non-specific tissue binding sites (protein adsorbance ) minimizing unwanted non-specific reaction with the primary antibody of interest.

Antibody diluent formulations can significantly alter stability and binding properties of antibodies affecting both epitope specificity and non-specific interactions

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Antibody diluents

Applied Immunohistochemistry & Molecular Morphology 9(2): 176–179, 2001

### Formalin-Fixed and Heat-Retrieved Tissue Antigens: A Comparison of Their Immunoreactivity in Experimental Antibody Diluents

Thomas Boenisch, M.S.

**Demonstrated that:**

**pH of the Ab-diluent had a high impact on the IHC result**

**Addition of NaCL (increasing the ionic strength) to the diluent negates most of the sensitivity gained through Antigen Retrieval (Table 3).**

**Antibody diluent formulations can significantly alter stability and binding properties of antibodies affecting both epitope specificity and non-specific interactions**

**TABLE 3.** *Comparison of staining scores of 13 optimally diluted antibodies as a function of antigen retrieval at pH 9.9, use of 0.05 M Tris (TB), pH 6.0 and 8.6, or Tris-buffered 0.15 M NaCl (TBS) of pH 6.0 and 8.6, and 0.02 M phosphate-buffered 0.15 M NaCl of pH 7.5 (PBS)*

Ductal breast carcinoma (A and B) and urothelial carcinoma (C and D) stained for GATA3 (clone L50-823) in two laboratories. Optimal results in A and C, insufficient in D. The only difference in protocols is the antibody dilution buffer: In A and C the antibody was diluted in Biocare Renoir red (ph 6.2). In B and D the Dako antibody diluent pH 7.3 was used.

# Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

## Problems related to the choice of the detection system:

- Provides low sensitivity
  - 2 versus 3-step multimer/polymer detection systems
- Provides low specificity and sensitivity
  - Biotin based systems

**False positive or false negative results**

**Table 3** Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

**19% insuff.**

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

## CD4 – Endpoint titration (some general remarks and important issues):

- The 3-step polymer detection systems Quanto and Flex+ - produced the overall highest intensity.
- Intensity was highly influenced by the nature of primary Ab and "optimal" staining could only be obtained with the Rab (CD4, EPR6855) used in combination with the 3- step polymer detection systems Quanto or Flex+.
- Intensity was higher with the Rab (CD4, EPR6855) at 1:50 with all of the detection systems tested compared to any intensity obtainable with the Mab (CD4, 1B12) even with the use of a 3-step polymer system ( e.g. Quanto).

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

**Performance testing of detection systems (Vendor recommended protocol settings)**

**CD4, EPR6855 (Rab, 1:50) and 1B12 (Mab, 1:50)**

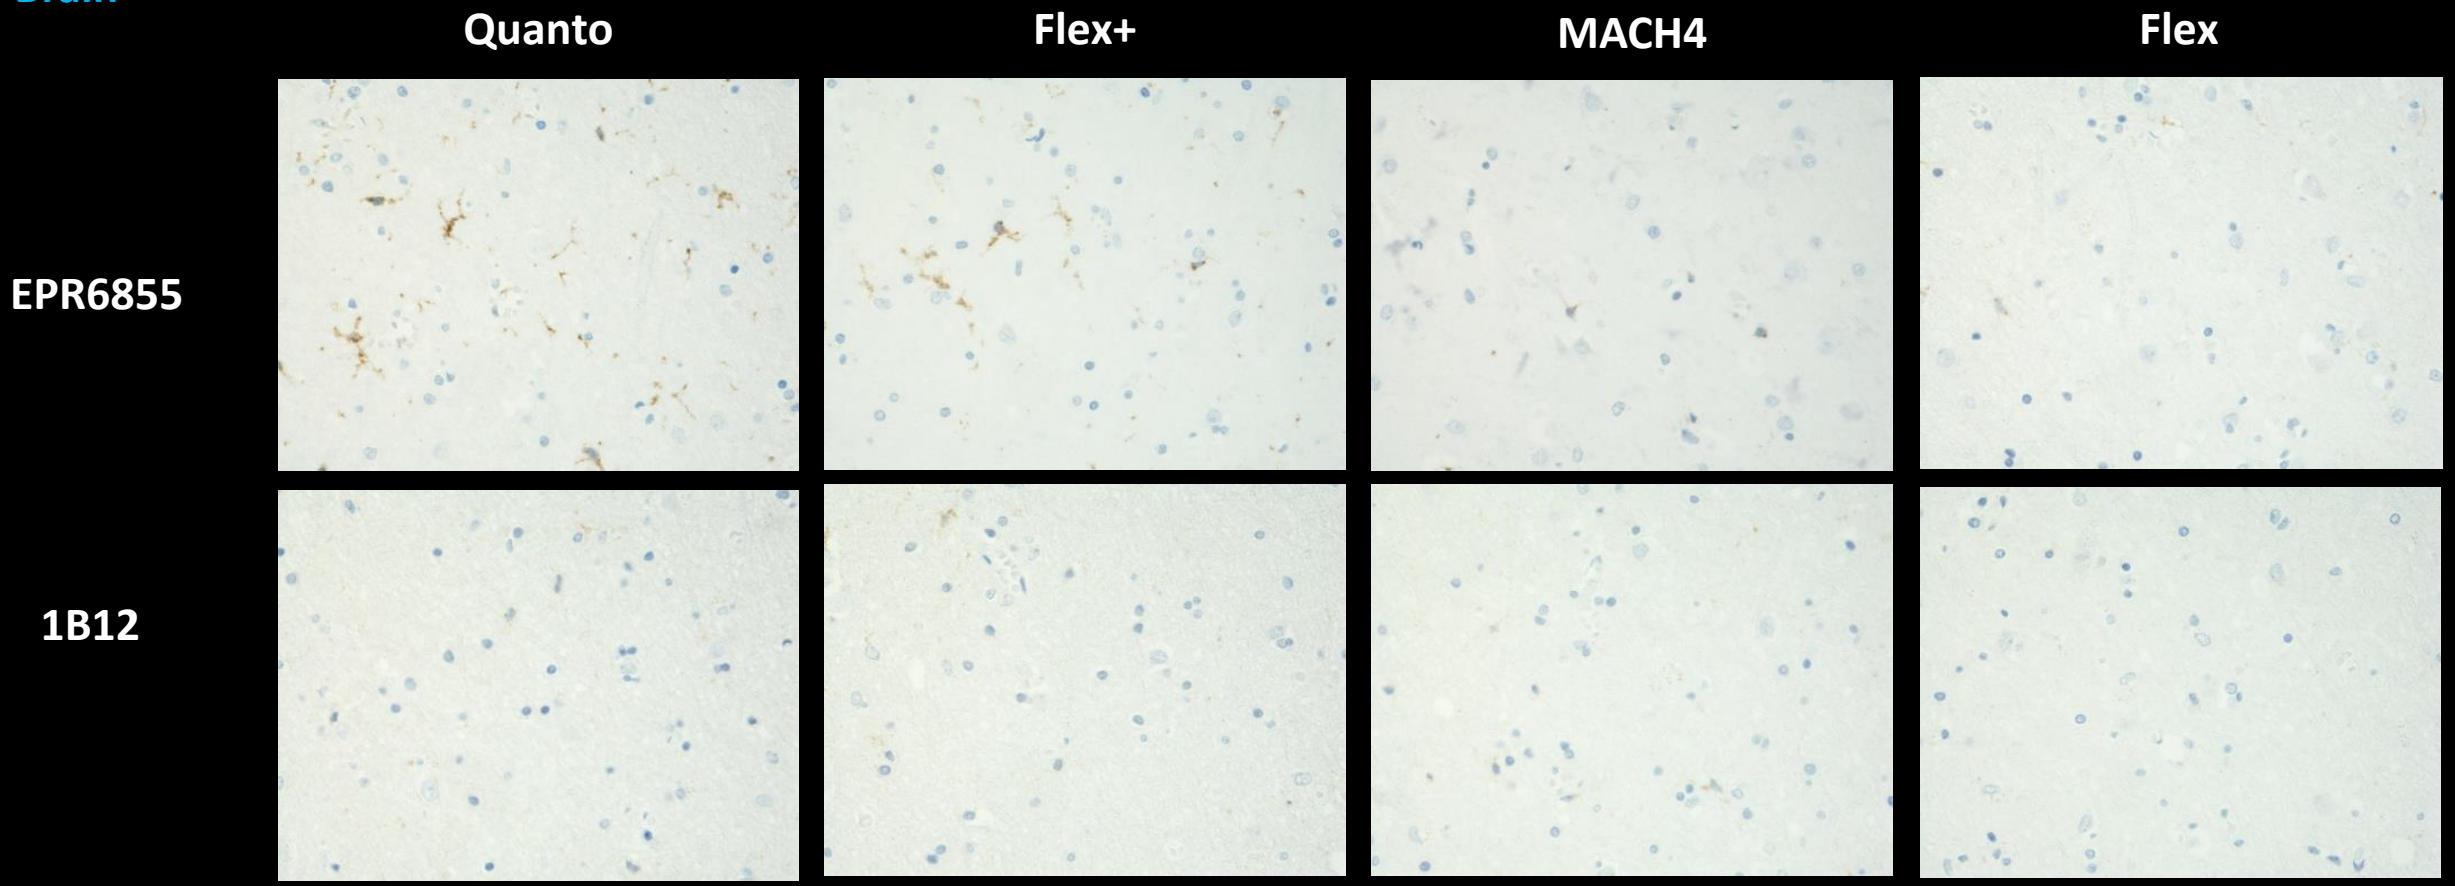
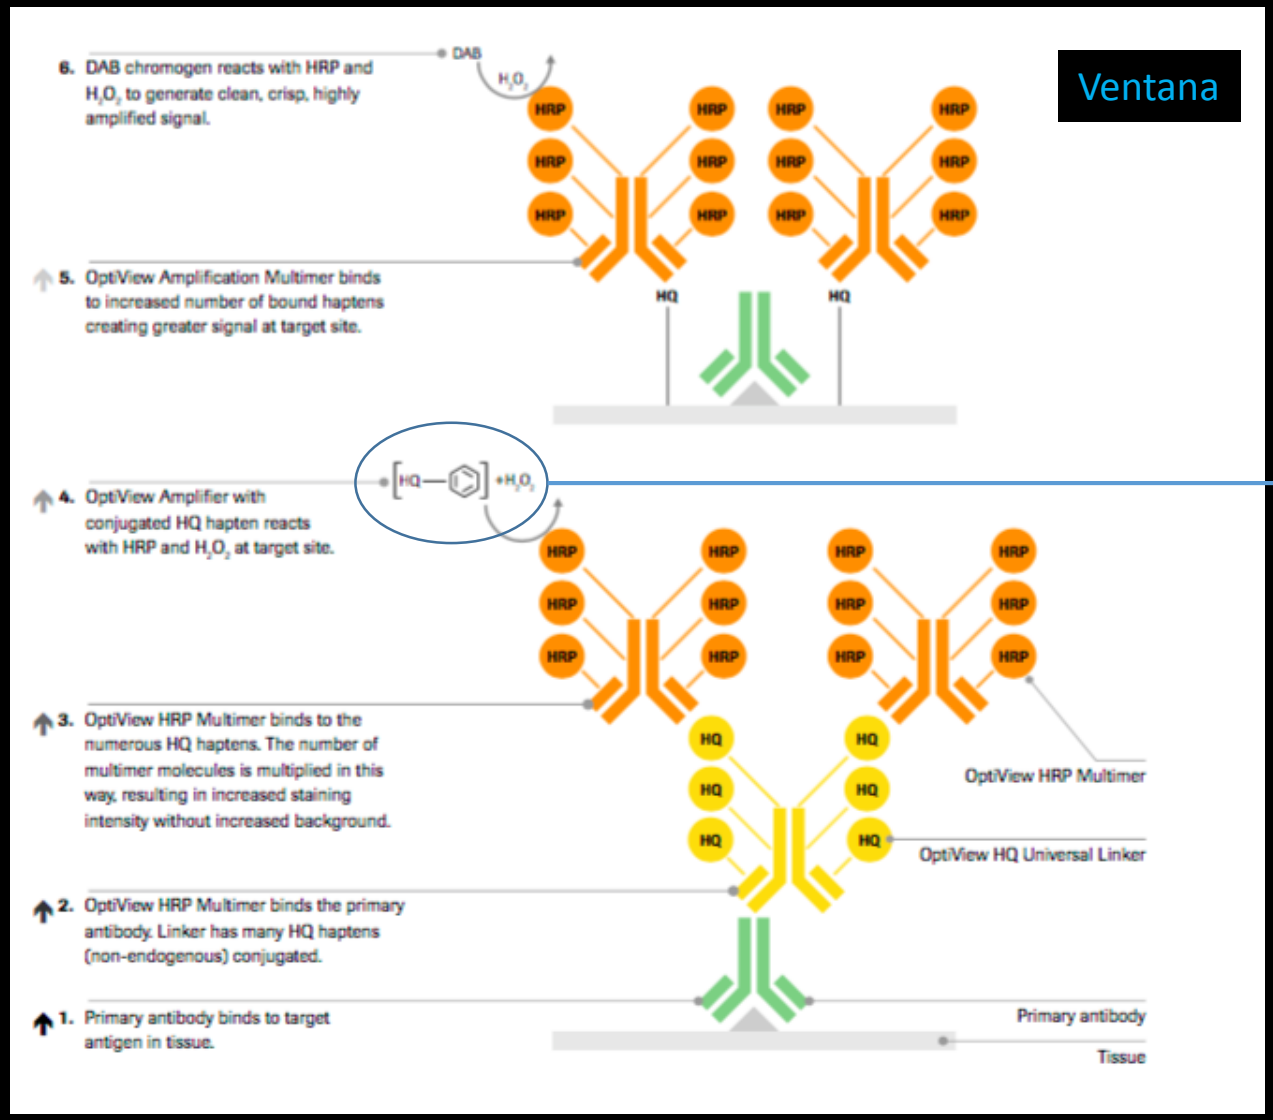
**Brain**



**Staining of microglia cells is only obtainable using the Rab (CD4, EP1628Y) and the 3-step polymer detection systems Quanto or Flex+.**

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase



## Tyramide Signal Amplification

**Mechanism of Tyramide amplification:**

- Introducing HRP (Optiview)
- Incubation with HQ-labelled Tyramide + H2O2

Tyramide, a phenolic compound, is converted into an short-lived extremely reactive intermediate

- Deposit HQ molecules in close vicinity of Ab/Ag reactions

Intermediates covalently binds to electron rish regions of adjacent proteins ( esp. tyrosine) – rapidly

- Detection of HQ with anti-HQ / HRP Multimer
- Visualization with DAB

# Technical aspects of immunohistochemistry & pitfalls - Analytical phase

## Concentration dependent and adverse effects in immunohistochemistry using the tyramine amplification technique

Michael Mengel[1], Martin Werner[2] & Reinhard von Wasielewski[1,*]

[2]*Institut für Pathologie der Technischen Universität München, Germany*
**Author for correspondence*

Received 8 September 1998 and in revised form 1 December 1998

**Summary**

Although the tyramine amplification technique to enhance sensitivity in immunohistochemistry has been described in numerous methodological papers, it has not yet gained access to diagnostic immunohistochemistry. This is mainly due to problems and pitfalls occurring in adaptation of this method to routine application.

In this study a monoclonal antibody and a polyclonal antiserum (pan-cytokeratin and anti-myoglobin) were tested in tissues with different amounts of epitopes, using a checkerboard table and testing a total of 133 different dilution combinations of both the tyramide solution and the primary antibodies.

The specific tissue investigated, i.e. the amount of accessable epitope to be detected and the applied concentration of the tyramide solution mainly influenced the staining reaction. Several pitfalls such as an uneven distribution of the staining or dramatic overstaining (paradoxical overstaining) must be considered to achieve optimal results.

In conclusion, our data confirm methodological studies that the tyramine amplification technique is a powerful method to enhance immunohistochemical sensitivity. However, for reliable daily practice several pitfalls of the technique have to be circumvented.

## TSA and pitfalls:

**False positive staining**

**Weak or completely false negative staining – unbalanced reaction of primary Ab and target epitopes giving an yes or no answer ?**

**Uneven distribution of the TSA reaction product**

# OptiView + TSA

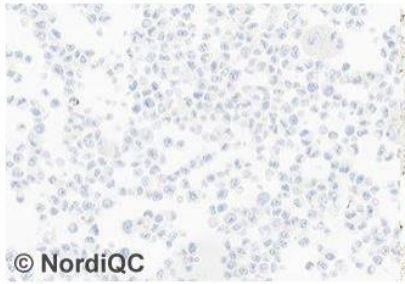

Fig. 6a
Optimal ALK staining of the cell line without ALK rearrangement using same protocol as in Figs. 1a – 5a. All cells are unstained.

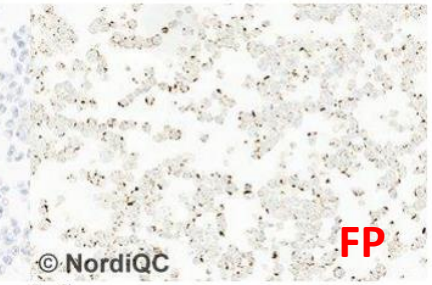

Fig. 6b
Aberrant ALK staining of the cell line without ALK rearrangement using the Ventana Ready-To-Use system based on the rmAb clone D5F3, prod. No. 790-4794. The vast majority of cells show an intracytoplasmic dot-like staining reaction.
This aberrant result was seen in a high number of protocols based on this system (31 of 51). As the system otherwise provided the results expected in all the histological specimens tested, the unexpected result in the cell line was not encountered in the final assessment score.
The positive staining reaction most likely was due to the tyramide based amplification step interacting with an unknown sequence in the cell lines. As such negative reagent controls omitting the primary antibody revealed same reaction in both cell lines included.
Also compare with Figs. 7a and 7b using same protocol/system in the two lung adenocarcinomas, where the result expected is obtained.

**Lu-ALK**

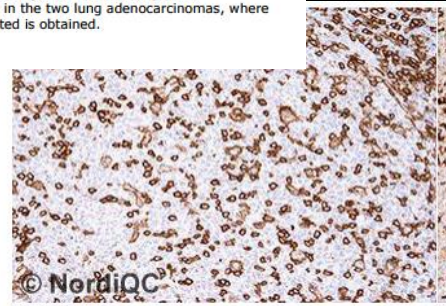

Fig. 1a (x200)
Optimal CD4 staining of the tonsil using the rmAb clone SP35 as a concentrate, HIER in an alkaline buffer (CC1 pH 8.5) and a 3-step multimer based detection system (OptiView, Ventana) - same protocol used in Figs. 2a - 4a. The inducer/helper T-cells show a strong staining reaction, while the germinal centre macrophages show a moderate and distinct membranous staining reaction - compare with Fig.1b.

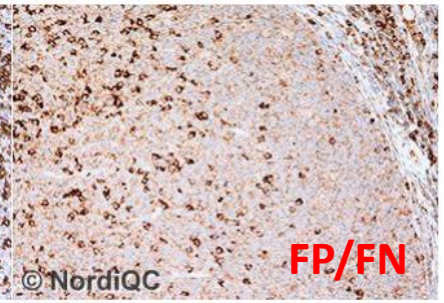

Fig. 1b (x200)
Insufficient CD4 staining of the tonsil using the mAb 4B12 as a concentrate, HIER in an alkaline buffer (CC1 pH 8.5) and a multimer based detection system (OptiView with Tyramide amplification, Ventana) -same protocol used in Figs. 2b-4b. The protocol provided a too low sensitivity, but also poor signal-to-noise ratio and false positive staining. No staining of germinal centre macrophages is seen and simultaneously B-cells are labelled. The pattern of too weak staining reaction was observed with all protocols based on the mAb 4B12 performed on the Ventana BenchMark platform - compare with Fig. 1a (same field).

**CD4**

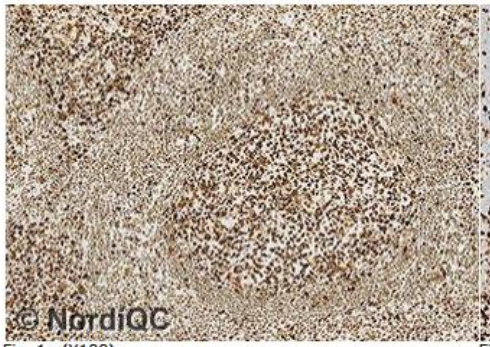

Fig. 1a (X100)
Optimal MSH6 staining reaction of the tonsil using the rmAb clone EP49, optimally calibrated, HIER in an alkaline buffer and a 3-step multimer based detection system (OptiView, Ventana). Virtually all mantle zone B-cells show a moderate and distinct nuclear staining reaction, while the germinal centre B-cells show a strong nuclear staining reaction. Also compare with Figs. 2a - 4a, same protocol.

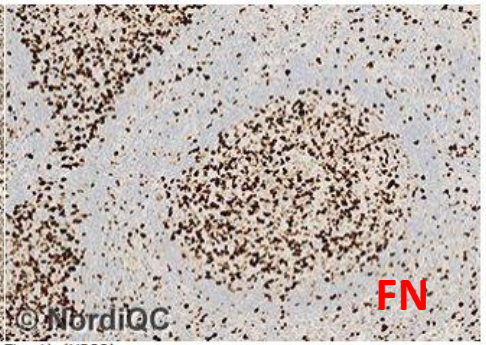

Fig. 1b (X200)
Insufficient MSH6 staining reaction of the tonsil using the rmAb clone EP49 with a protocol providing a too low sensitivity- same field as in Fig. 1a.
Only the germinal centre B-cells are distinctively demonstrated, while mantle zone B-cells expressing low level MSH6 virtually are unstained. The protocol was based on OptiView + amplification (Ventana) and the combination of a too low titre of the primary Ab and the use of tyramide based amplification provided an inadequate balance of the staining reaction.
Also compare with Figs. 2b - 4b, same protocol.

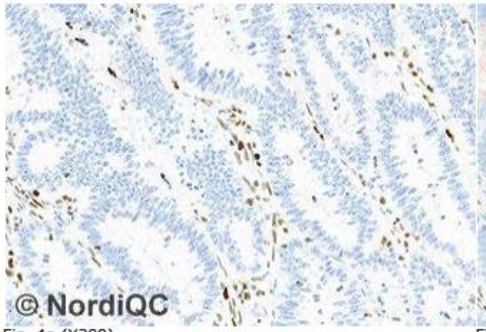

Fig. 4a (X200)
Optimal MSH6 staining reaction of the colon adenocarcinoma no. 4 with loss of MSH6 expression using same protocol as in Figs. 1a - 3a. The neoplastic cells are negative, while stromal cells show a distinct nuclear staining reaction serving as internal positive tissue control.

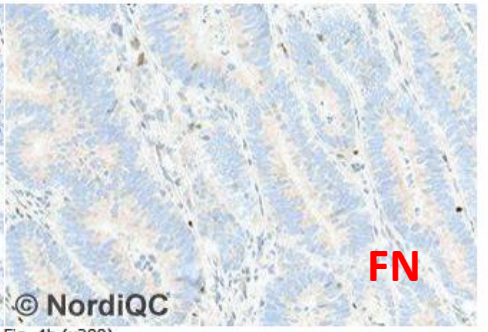

Fig. 4b (x200)
Insufficient MSH6 staining reaction of the colon adenocarcinoma no. 4 with loss of MSH6 expression using same protocol as in Figs. 1b - 3b – same field as in Fig. 4a. No nuclear staining reaction in the neoplastic cells is seen, but as only an equivocal nuclear staining reaction in the normal stromal cells is present, the staining pattern cannot reliably be interpreted. In addition a weak aberrant cytoplasmic staining reaction is seen.

**MSH6**

**The TSA detection system is not without problems and may provided either false positive or negative results.**

**All parameters should be careful calibrated to provide optimal staining result - always possible ?**

# The future - The key to “low sensitive” detection system ?

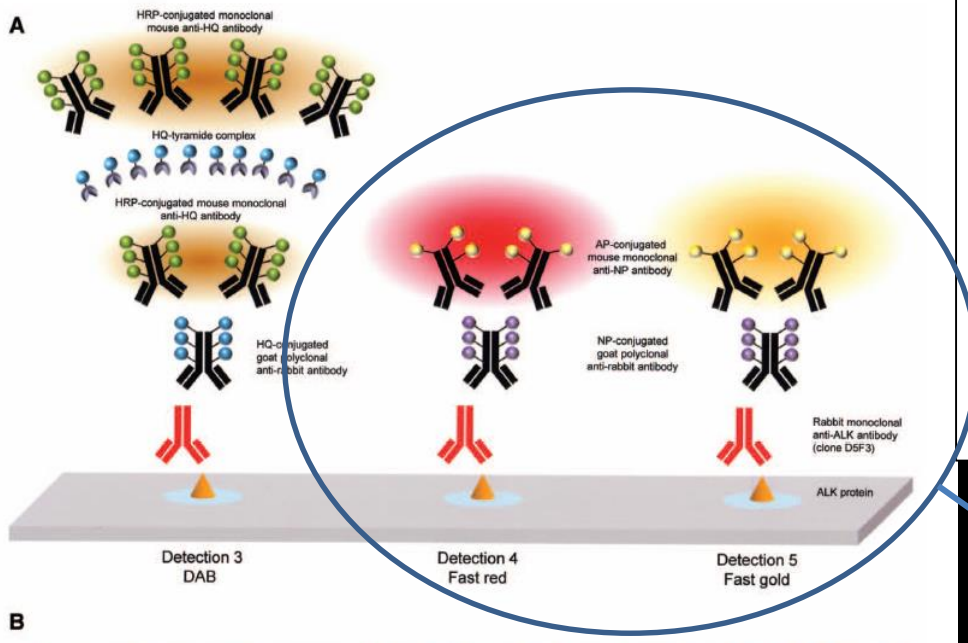

FIGURE 4. Comparison of a tyramide-amplified DAB IHC ALK-detection method (detection 3) with two AP-based IHC ALK-detection methods (detections 4 and 5). *A*, Schematic comparison of the IHC methods. Detection 3, which uses HQ-conjugated, tyramide-amplified IHC detection with HRP-catalyzed deposition of DAB, was used as a control for assay sensitivity. Detections 4 and 5 both use a 5-nitro-3-pyrazole (NP)-conjugated secondary antibody and an AP-conjugated anti-NP antibody. For target visualization, detection 4 uses fast red, whereas detection 5 uses fast gold. *B*, Performance of tyramide-amplified DAB (detection 3; left)

Liver

# The basal fundament for a technical optimal performance is :

- **Appropriate tissue fixation and processing**
- **Appropriate and efficient epitope retrieval**
  - 95% of the Abs require HIER and app. 90% prefer high pH retrieval buffers.
  - Use efficient HIER temperature and time (app. 100°C for 20 - 40min).
- **Appropriate choice of antibody / clone, diluent and dilution**
  - Compare different clones / Abs against the desired antigen before implementation
  - Calibrate the Ab concentration carefully
- **Robust, specific & sensitive detection system**
  - Use of a 3-step multimer/polymer system is preferable to a 2- step multimer/polymer system
  - Don`t use biotin-based detection systems
- **Appropriate choice of control material**
  - Focus on Immunohistochemistry Critical Assay Performance Controls (iCAPCs)

# Mechanisms of Heat-induced Antigen Retrieval: Analyses In Vitro Employing SDS-PAGE and Immunohistochemistry

Shuji Yamashita and Yasunori Okada

Electron Microscope Laboratory (SY) and Department of Pathology (YO), School of Medicine, Keio University, Tokyo, Japan

**SUMMARY** In this study, we examined the mechanism of heat-induced antigen retrieval using analytical procedures involving SDS-PAGE, Western blotting, and immunohistochemistry. Five proteins were treated with 4% formaldehyde in the presence or absence of 25 mM $CaCl_2$, then heated under various conditions after removal of formaldehyde and analyzed on SDS-PAGE. Formaldehyde produced inter- and intramolecular cross-links in the proteins. Heating at high temperatures cleaved these cross-links at all pH ranges examined (pH 3.0, 6.0, 7.5, 9.0) and produced almost the same electrophoregrams as the native proteins. Proteins treated with formaldehyde containing $CaCl_2$ showed similar electrophoretic patterns, observed without heating or after heating at pH 6.0 and pH 9.0 in the presence or absence of 10 mM EDTA. Western blot analyses demonstrated that the soluble forms of β-actin (monomer and oligomers) and fibronectin were present in extracts from deparaffinized mouse uterine sections autoclaved for 15 min but not in extracts from unheated specimens. Nine of ten antigens, independent of their isoelectric points, exhibited much stronger immunoreaction in the sections heated at pH 9.0 than in those heated at pH 6.0. The second heating at pH 6.0 significantly decreased the immunostaining of the antigens that had been boiled at pH 9.0, but the immunostaining was recovered after a third heating at pH 9.0. These results suggest that the main mechanism of heat-induced antigen retrieval is disruption of the cross-links and that pH is an essential factor for a proper refolding of epitopes. (J Histochem Cytochem 53:13–21, 2005)

| α-Amylase | 6.5 | +++ | ++ | ++ | ++ | ++ | ++ | ++ |
| β-Actin | 5.2 | + | + | ++ | ++ | +++ | ++ | +++ |
| Fibronectin | 5.9 | + | − | ++ | − | ++ | ± | +++ |
| Laminin | 5.4 | ++ | − | + | − | + | − | + |

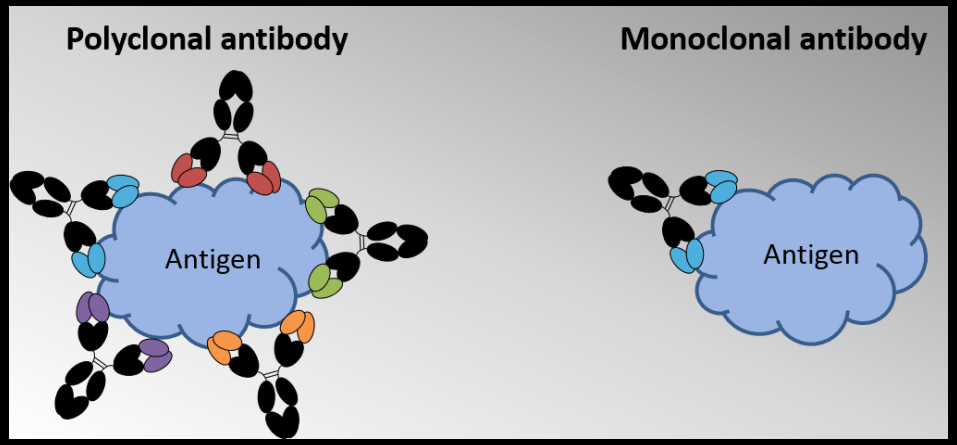
[a]Immunostaining was scored as follows: +++, strong; ++, moderate; +, weak; ±, faint; −, negative.

**Results from this study suggested that:**

**The main mechanism of heat-induced antigen retrieval is disruption of the cross-links formed by formalin fixation (confirming earlier hypothesis to this subject)**

**pH of the antigen retrieval buffer is an essential factor for a proper refolding of epitopes favoring better reactions with respective antibodies**

**High pH antigen retrieval buffers seems to be more efficient (Table 1)**



Antibodies bind to antigen through the variable regions of the antibody.

The strength of the binding of an antibody to a specific epitope is called affinity.

High affinity antibodies will bind larger amounts of antigen in a given period of time, and can be used at higher dilutions.

## Immunohistochemistry : Key differences between Polyclonal and Monoclonal Antibodies

| Polyclonal | Monoclonal |
|---|---|
| Heterogeneous population of antibodies reacting with different epitopes of an antigen | Homogenous population of a specific antibody reacting with one epitope of an antigen |
| Not Epitope Specific | Epitope Specific |
| Increased likelihood for cross-reactivity with similar antigens | Low cross-reactivity |
| Increased likelihood for background noise | Low background noise |
| Lot Variability | Identical lots |
| Many host species options<br>- Normally Rabbit antibodies | Few host species options<br>- Normally Mouse or Rabbit |

## Purpose

**What do we want to detect and what is the intended use of the assay ?**

## "Fit-for-purpose"

**Describes an assay that has been successfully validated for the intended use at the time the assay was developed combining both laboratory and clinical definitions.**

**In other words: An assay that is "fit-for-purpose" is good enough to do the job it was designed to do**

## Expectations of the biomarkers/assays:

**It may or will improve diagnosis**
**It may or will define disease subsets that may differ in response to therapy.**
**It may or will provide early clues regarding response to therapy.**
**It may or will define individual variability in the drug's molecular target**

# IHC: Technical considerations to intended use and “fit-for-purpose” approach

Do we have the right antibody (IHC type markers 1 & 2) – can it provide appropriate sensitivity and specificity

Does  the antibody work on the chosen automatic platform(s)

Does the automatic platform come with appropriate reagents fulfilling purpose and intended use of the IHC assay

- Appropriate Antigen  Retrieval solutions (enzymes and HIER buffers)

- Appropriate antibody diluents and wash buffers

- Appropriate detection and visualization products

- Appropriate protocol library

Do we have access to appropriate tissue, reflecting the range of different antigen expression levels,  both for the optimization process but also for the laboratory`s internal quality assurance program (control tissue) – monitoring specificity and sensitivity of the assays

# The technical test approach – Analytical phase

Scores in parentheses are the results of AR for 60 mins.

TABLE 2. Staining Intensities of Several Tissue Antigens Following 3 Months of Formalin Fixation and Heat-Induced Antigen Retrieval (AR) at 121°C

5`

| Antigen | Antibody Clone | AR 121°C | AR 97°C |
|---|---|---|---|
| B-cell, 33 kD | L26, 1:200 | 4 | 4 |
| CDw75 | LN-1, 1:100 | 4 | 3 |
| CD43 | DF-T1, 1:200 | 3 | +/− |
| HLA-DRα | TAL.1B5, 1:100 | +/− | 1 |
| Ki-67 | KiS5, 1:50 | 4 | 1 |
| Ki-1 | BerH2, 1:50 | 2 | 1 |
| Lambda | N10/2, 1:100 | 4 | 0 |

Staining intensities after retrieval at 97°C for 20 minutes are listed for comparison.

**Demonstrated that:**

**Optimal staining of 26 of the 30 antigens was achieved despite the variable length of fixation (up to 8 days of fixation).**

**Prolonging HIER time or increasing HIER temperature could restore antigen determinants more efficiently compared to standard HIER protocols in “over fixed” tissue**

# The technical test approach – Analytical phase

**Problem: Primary antibody provides low specificity and/or poor signal-to-noise ration**

Table 1. **Antibodies and assessment marks for p40, run 48**

1) Proportion of sufficient stains (optimal or good)
2) Proportion of sufficient stains with optimal protocol settings only, see below.

## pAbs

**No optimal results / pass rate of 23% (5 of 22)**

**The insufficient results were typically characterized by a poor signal-to-noise ratio and aberrant staining reaction compromising the interpretation.**
