

Workshop in Diagnostic Immunohistochemistry NordiQC (October 2022)

Immunohistochemical double/multiplex techniques

Overview, considerations and applications

Michael Bzorek

Histotechnologist

Department of Surgical Pathology

University Hospital, Region Zealand, Denmark

Double/Multiplex staining techniques (IHC)

Multiplex staining can be defined as the detection of two or more antigenic epitopes on one slide

Compared to single color IHC, the main advantage of multiplex IHC is two-fold:

First, it allows for the analysis of multiple parameters simultaneously on a single slide, it significantly decreases the amount of tissue required for assessment.

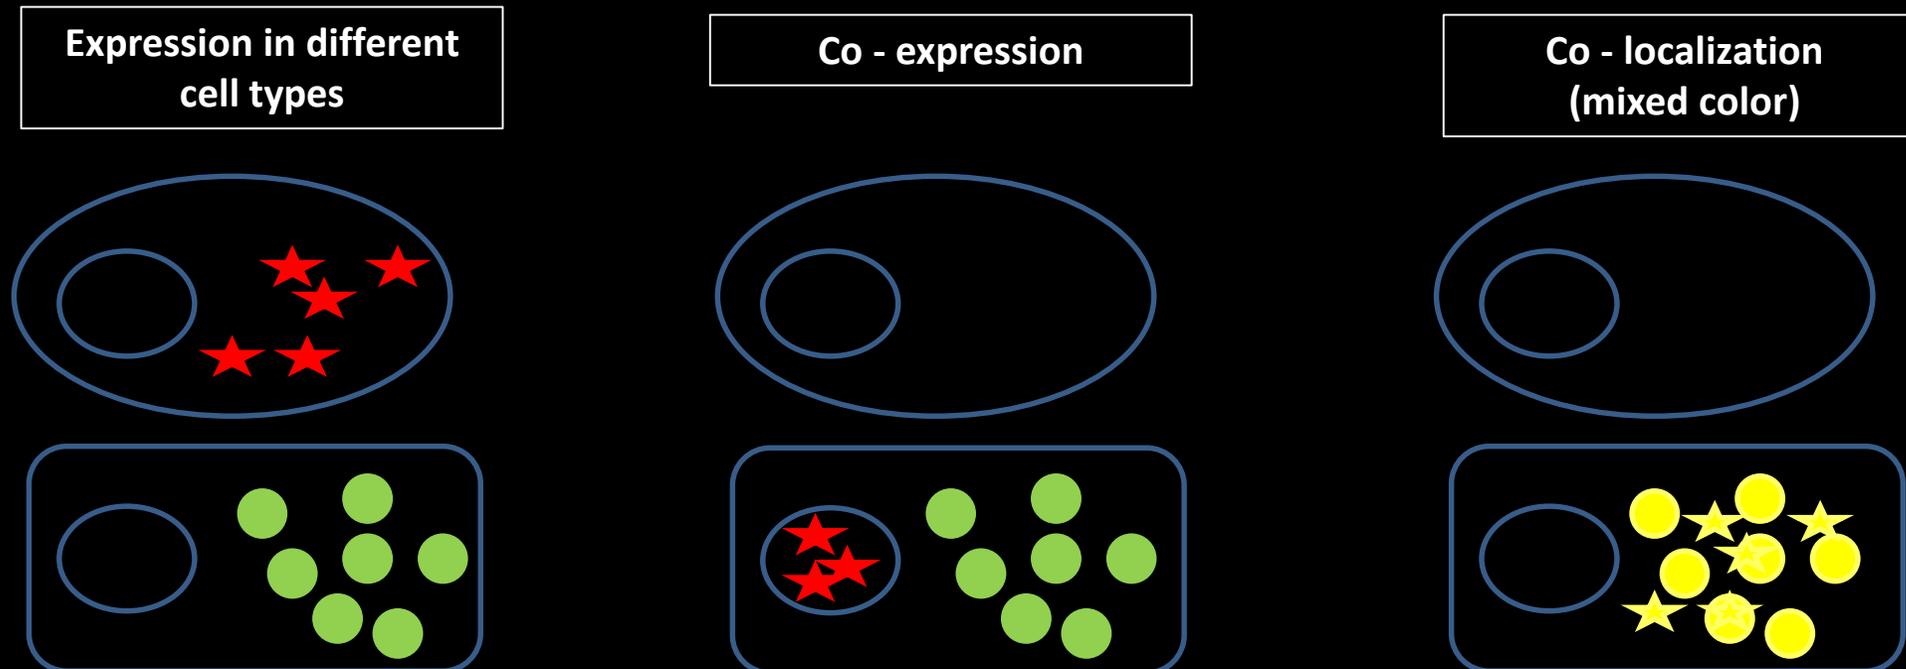

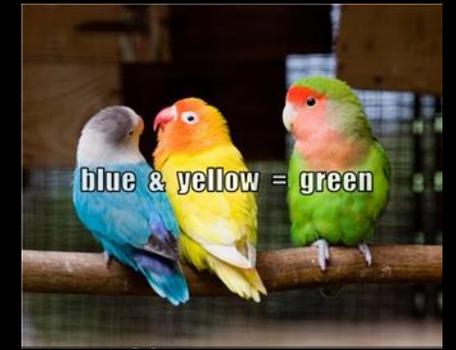

Second, perhaps more importantly, investigating the spatial relationship between multiple cells in cancerous tissue

e.g., understanding of the complexity of the tumor microenvironment has led to advances in therapies for patients with cancer (Immunotherapy).

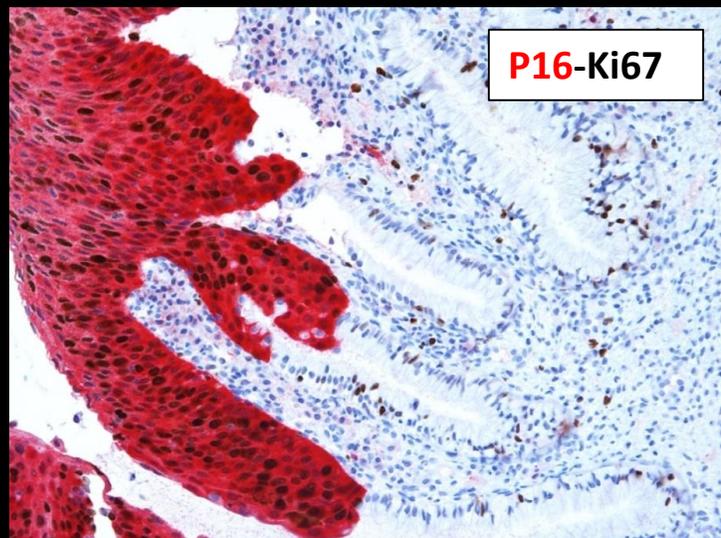

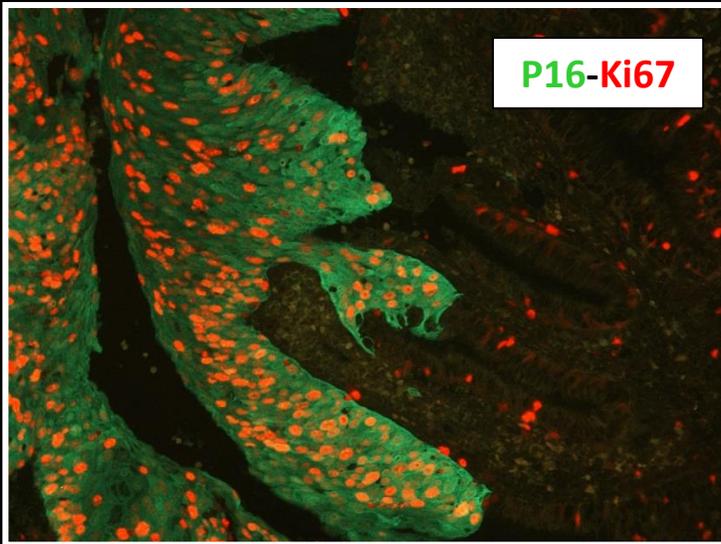

Multiplex staining techniques (IHC)

Requirements (“traditional double-staining techniques”) :

- ❑ Two (or more) visualization systems showing no cross-reactivity
- ❑ Two (or more) chromogens showing high color contrast and allowing mixed colors at sites of co-localization

Cervix / dysplasia

Multiplex techniques (IHC)

Basic procedures:

- Cocktails single staining technique (e.g., PAN-CK, AE1/AE3; PIN)
- Sequential double-staining technique
- Simultaneous double-staining technique
- Sequential & erasing staining technique (SIMPLE)
- Virtual double (multi) staining technique

Immuno-enzymatic techniques

Immuno- fluorescence techniques

Challenges or considerations performing multiplex staining techniques:

Which double or multi-staining technique should I use ?

Pre-treatment - do the antigens of interest require the same antigen retrieval procedure ?

Do primary Abs come in the correct format - important using simultaneous labelling techniques ?

Are primary Abs made in different host (e.g., mouse, rabbit) ~ **If not**

Are primary Abs of different Immunoglobulin type (e.g., IgG, IgM) or subclass (e.g., IgG1, IgG2) ~ **If not**

Is one of primary Abs available as a conjugate (e.g FITC, biotin)

Do the primary Abs have the right specificity and sensitivity

Do the detection systems of choice have the required specificity and sensitivity (e.g. Interspecies cross reactivity) ?

Are secondary Abs commercially available (app. conjugate) - matching choice of the primary Abs (important using simultaneous techniques)

Interspecies cross reactivity between primary Abs and secondary Abs (detection system) – pre-absorbed ?

Interspecies cross reactivity between secondary Abs (secondary Abs made in different host`s) – pre-absorbed ?

Which chromogens /fluorochroms should I use - depending on:

Type of conjugate (e.g., HRP, AP, Fluorochrom)

Color compatibility and allowing mixed color of chromogens (spectral differentiation) at sites of co-localization

Equipment (bright field versus fluorescence microscopy)

How can I inactivate the first set of antibody reagents - important using sequential labelling techniques ?

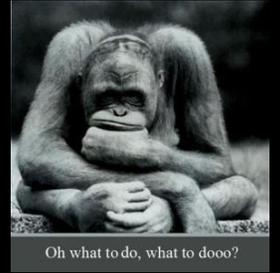

Elution of immuno-reagents (Abs) / Heat inactivation

Take advantage of that DAB, DAB based, or metallic deposit can shelter /block for following immunoreagents

How can I control the efficiency of the inactivating protocol

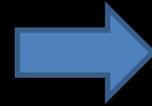

Controls

iCAPCs - compare individual staining results of the multi labelling technique with optimal single staining procedure (routine)

Multiplex staining techniques (IHC)

Are antigens of interest located in the same cellular compartment (e.g., the cytoplasm) ?

NO

Immuno-enzymatic DAB based sequential or simultaneous technique

YES

Double/multiplex immunofluorescence technique (simultaneous technique)

Double/multiplex immuno-enzymatic technique (simultaneous technique / sequential technique)

A reversed applications of the primary antibodies (sequential technique)

SIMPLE technique (Sequential Immunoperoxidase Labelling and Erasing Method)

Sequential procedure (Immuno-enzymatic/HRP+AP):

Pre-treatment (Antigen Retrieval)

First primary Ab

Detection with Quanto/Flex+/HRP

Visualization with DAB or Deep Space Black (DAB/Ni ?)

Second primary Ab (same or different host, Ig-type or subclass)

Detection with HiDef/Histo-AP

Visualization with Warp Red (Fuchin-Red)

Counterstain, dehydration and mounting.

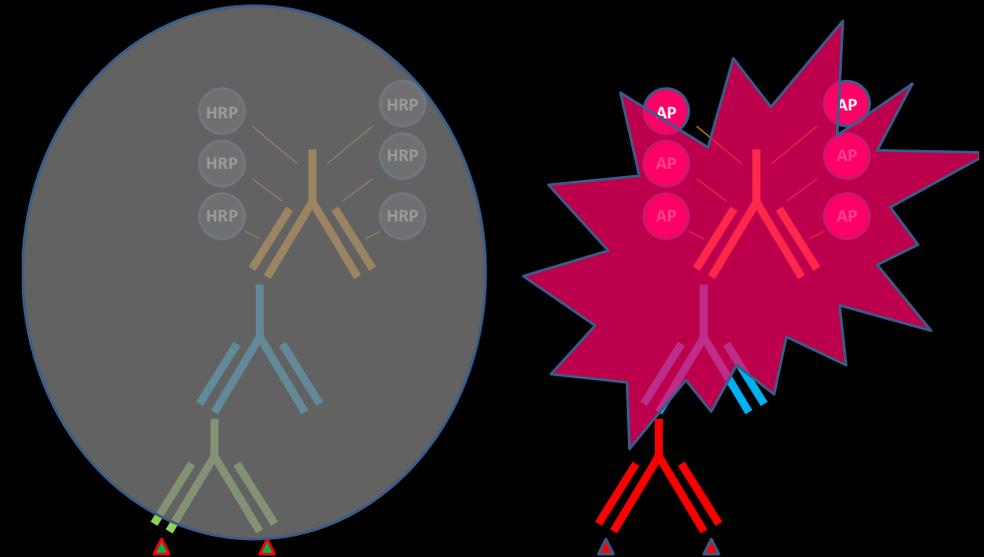

DAB reaction product of the first set of immunoreagents create a barrier that is impermeable for the second set of immunoreagents ~ no cross reactivity

Sternberger LA, Joseph SA. *J Histochem Cytochem* 27:1424, 1979

Valnes K and Brandtzaeg P. *J Histochem Cytochem* 1982; 30(6) 518-524.

Metallic deposits (e.g., EnzMET) has the same ability

Inactivation step or blocking procedures not needed

1.Set of Immuno-reagents

Deep Space Black
DAB/Ni ?

2. Set of Immuno-reagents

Warp Red
Fast Red / Fuchin-Red

Optimizing sequential double immuno-staining protocol

Either DAB based (shielding properties) or with blocking procedures between reaction series A & B

Testing (Routine purpose):

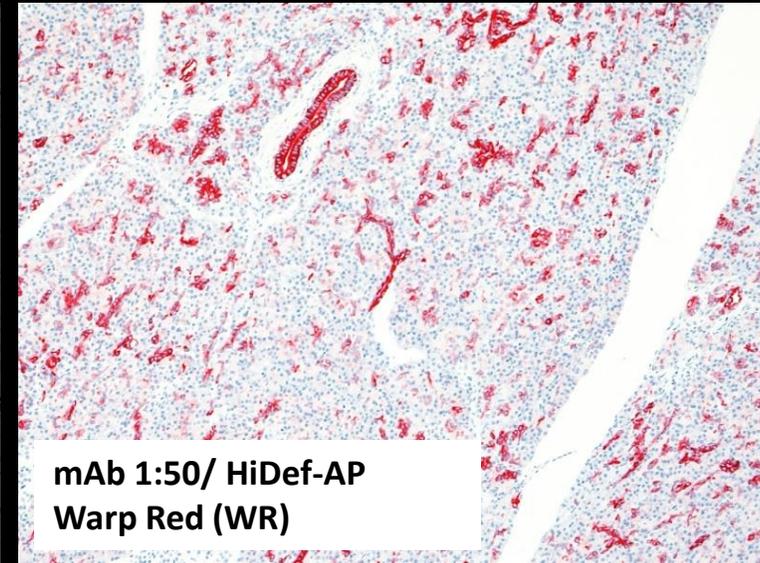

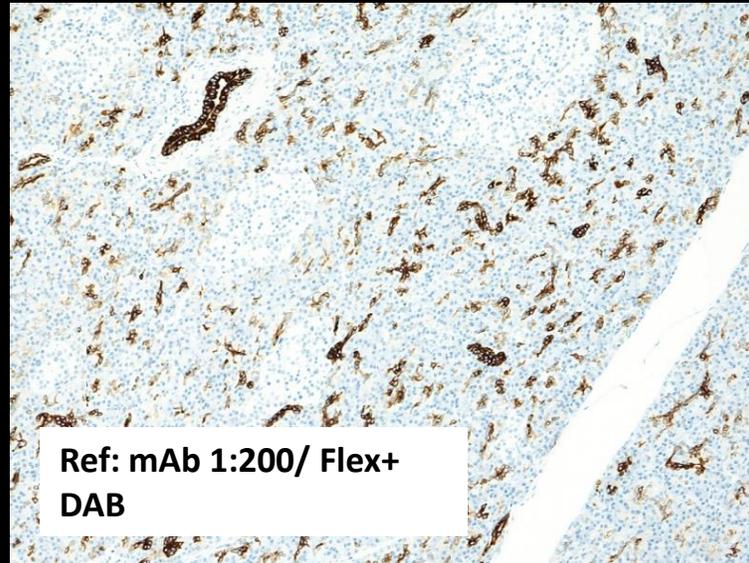

- Antibody A (dilution series) → Detection A → Chromogen A
 - Antibody B (dilution series) → Detection B → Chromogen B
- Calibrate titre (both primary antibody A & B) according to iCAPCs
- Antibody A → Detection A → Chromogen A
 - Diluent → Detection B → Chromogen B
- Control 1 (only reaction for A should be observed / no co-localized signals)
- Diluent → Detection A → Chromogen A
 - Antibody B → Detection B → Chromogen B
- Control 2 (only reaction for B should be observed / no co-localized signals)
- Antibody A → Detection A → Chromogen A
 - Antibody B → Detection B → Chromogen B
- Double staining

Typical end-result including controls: Optimizing the protocol

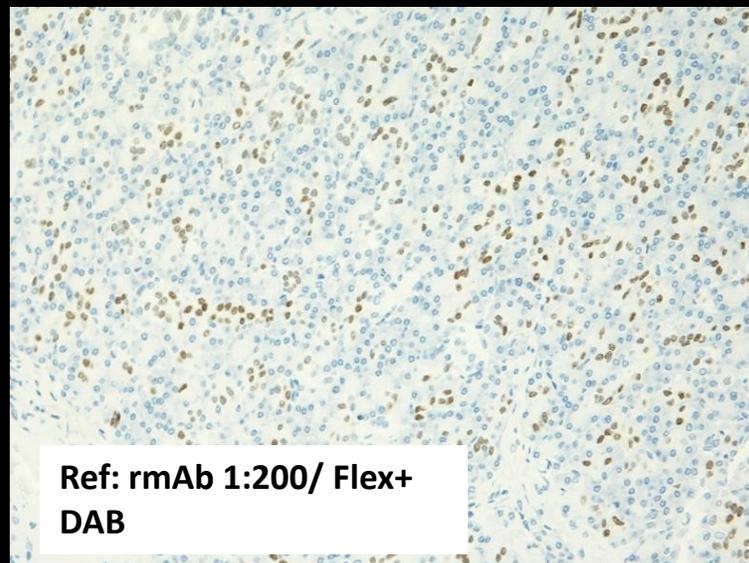

CDX2 (EP25) + CK7 (OV-TL 12/30)

Pancreas

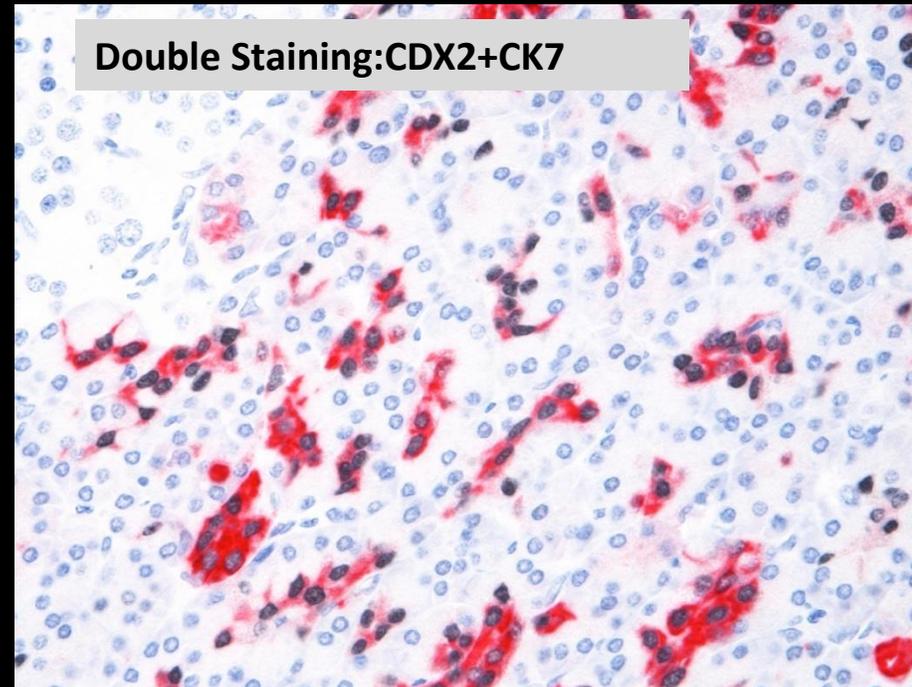

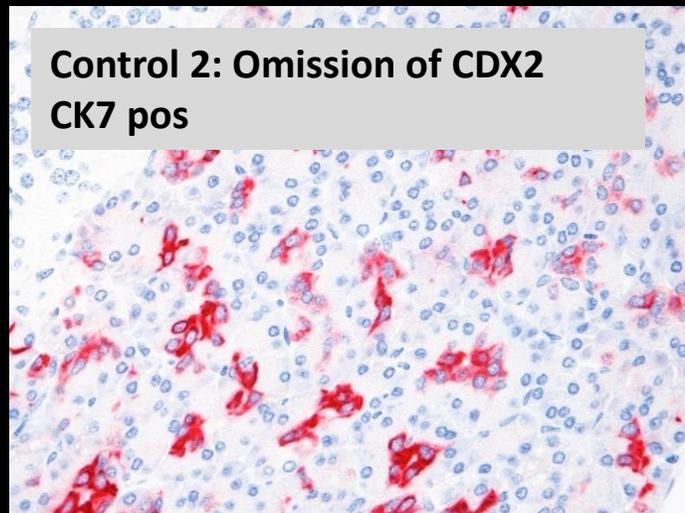

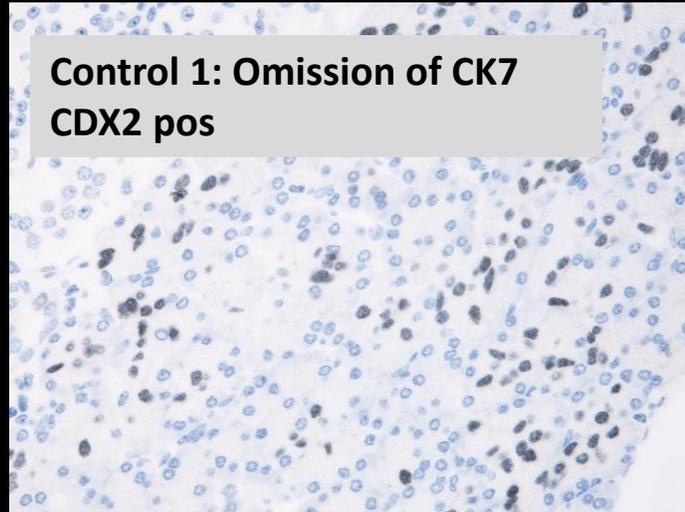

CK7, OV-TL12/30

CDX2, EP25

Typical end-result including controls: Optimizing the protocol
Optimal dilutions of CDX2 (EP25 1:50) and CK7 (OV-TL 12/30 1:50)
Sequential staining : Quanto-HRP/ DSB followed by HiDef-AP/WR

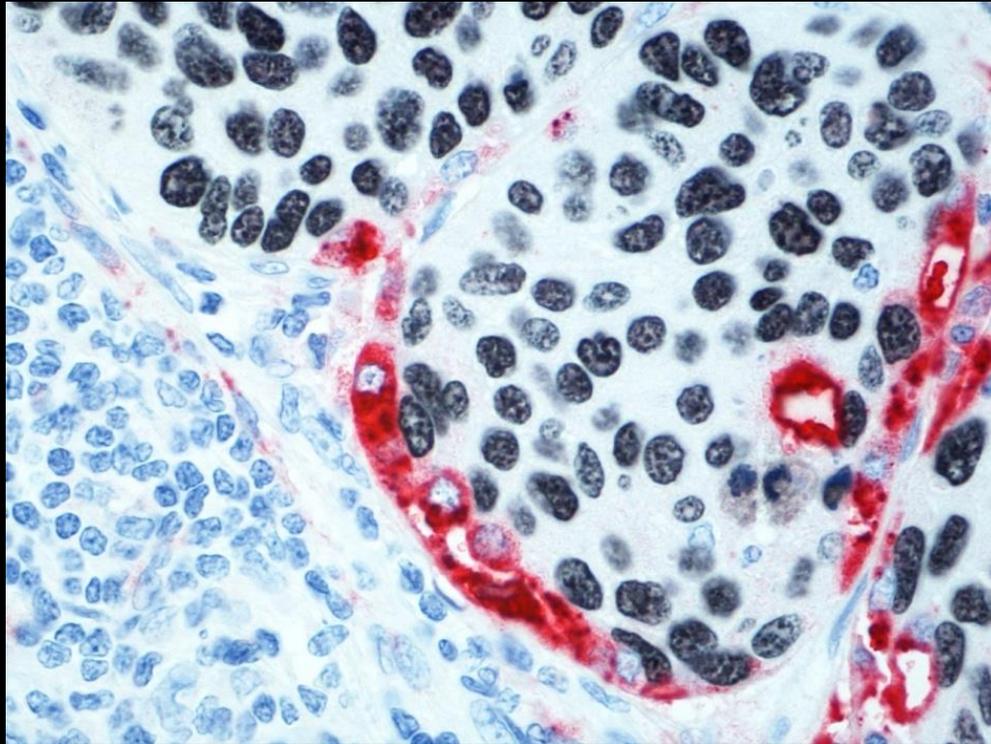

Pancreas

Note : Efficient sheltering capacity of Deep Space Black

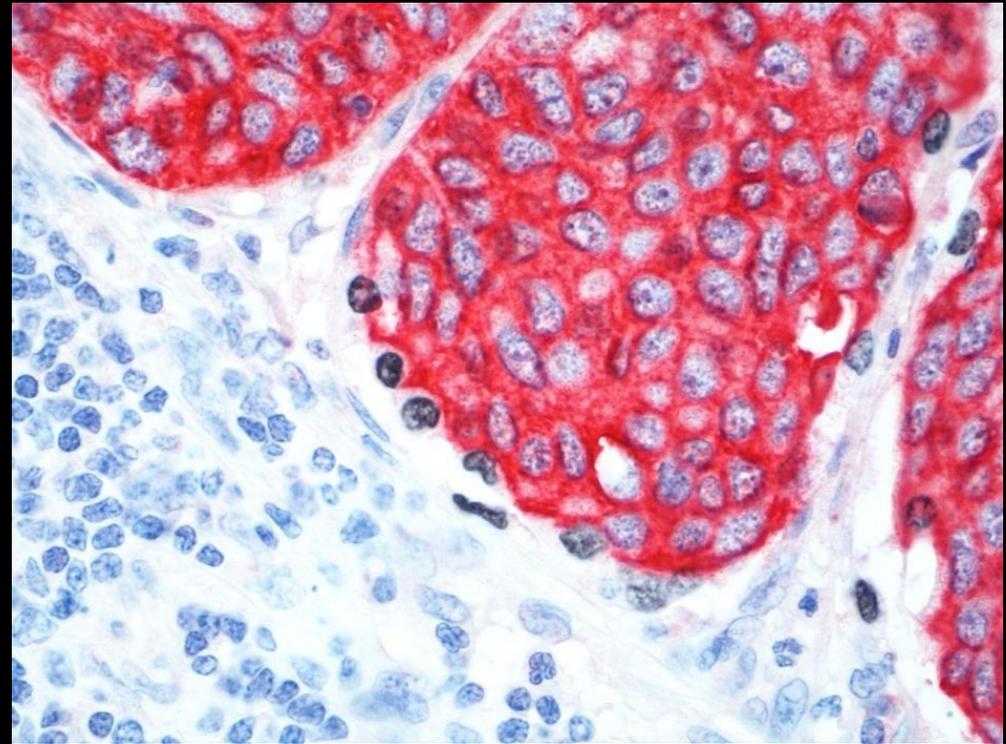

No mixed colors or double colors within controls and in the double staining for CDX2+CK7 (Intercalating ducts of the pancreas are positive for both markers)

Double staining using sequential technique (Immuno-enzymatic)

P40, BC28 (1:25) + **Napsin, IP64 (1:100)** (Mab+Mab)

TTF1, SPT24 (1:25) + **CK5, XM26 (1:100)** (Mab+Mab)

Lung : Squamous cell carcinoma

Other useful combinations: P40 + **CK5** and/or TTF-1+ **Napsin A**

Sequential procedure (Immuno-enzymatic/2xHRP):

Pre-treatment (Antigen Retrieval)

First primary Ab

Detection with Flex+/HRP (Dako)

Visualization with DAB (Dako).

Second primary Ab (same or different host, Ig-type or subclass)

Detection with Flex+/HRP (Dako)

Visualization with Magenta (Dako)

Counterstain, dehydration and mounting.

New options and reagents (Omnis/Dako)

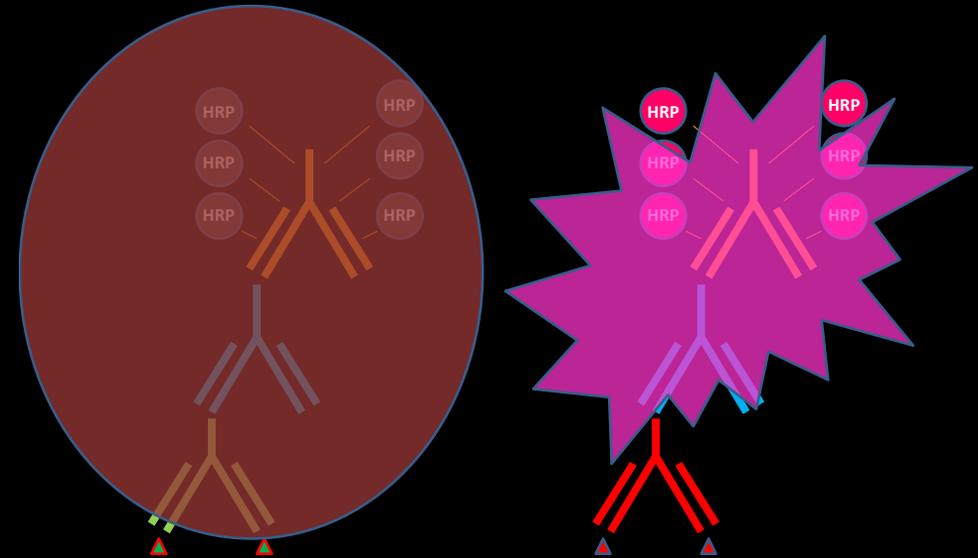

HRP Magenta Chromogen

Double staining protocol based on 2x Flex with or without linker.

Blocking procedure (H_2SO_4) after first set of immuno-reagents (elution)

Additional peroxidase block (H_2O_2)

Omnis

1. Set of Immuno-reagents

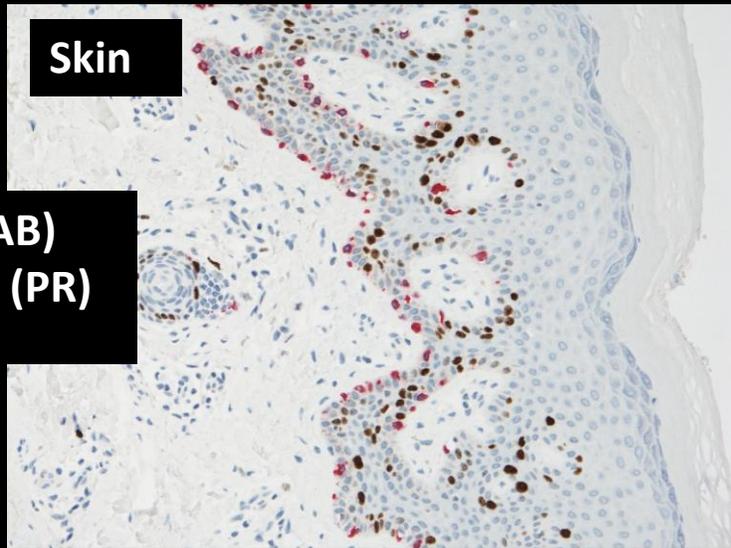

Flex+
DAB

2. Set of Immuno-reagents

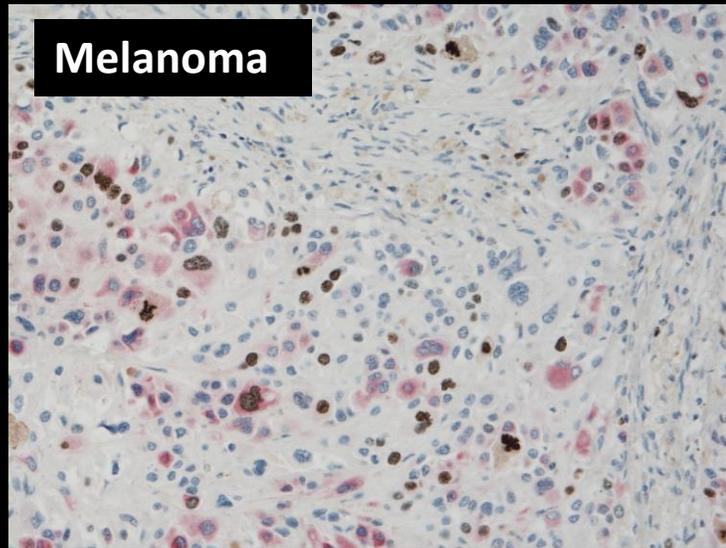

Flex+

Flex+ (MAG)**

Double staining using sequential technique (Immuno-enzymatic)

The order of primary antibodies

In general:

- ❑ Nuclear markers before cytoplasmic or membranous markers
- ❑ Membranous markers before cytoplasmic

- If a non-DAB based chromogen is applied and an antibody is difficult to elute (block for unwanted reactions) – apply this antibody in the last sequence

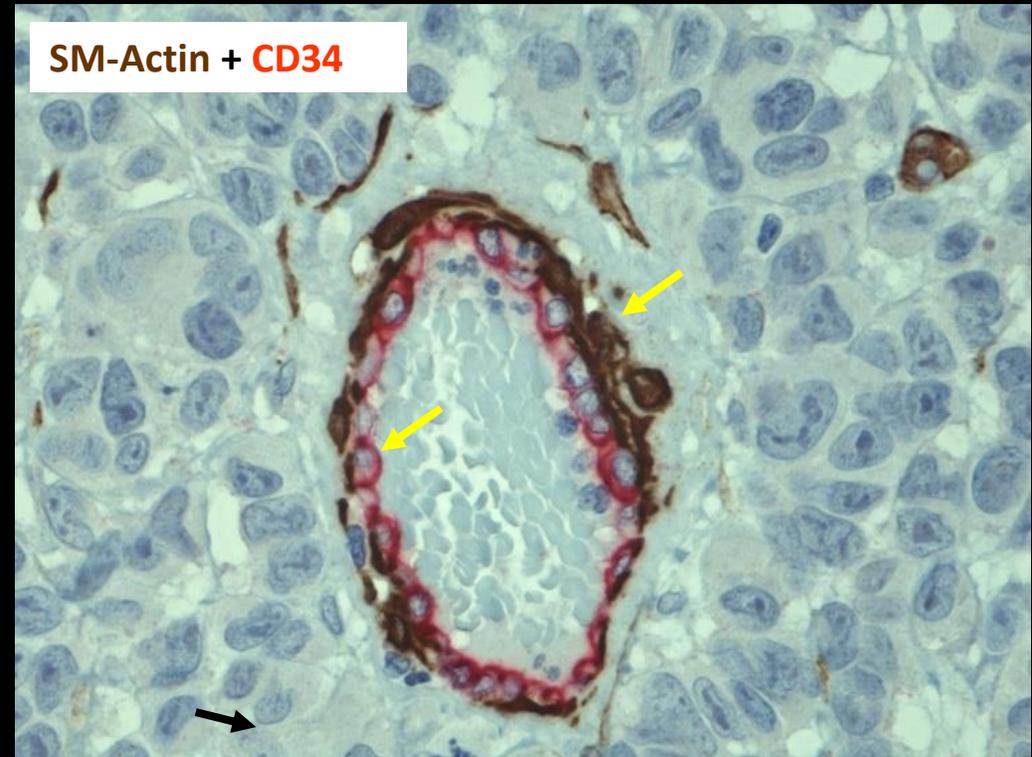

A reversed applications of the primary antibodies may un-ravel that :

DAB deposit shields for the second antigen of interest - first and second antigen are in proximity with each other (false negative result)

Co-localized signal is present due to expression of the two antigens of interest in the same cellular compartment

Double staining using sequential technique (Immuno-enzymatic)

CD34 (QBEND 10) + SM-Actin (1A4)

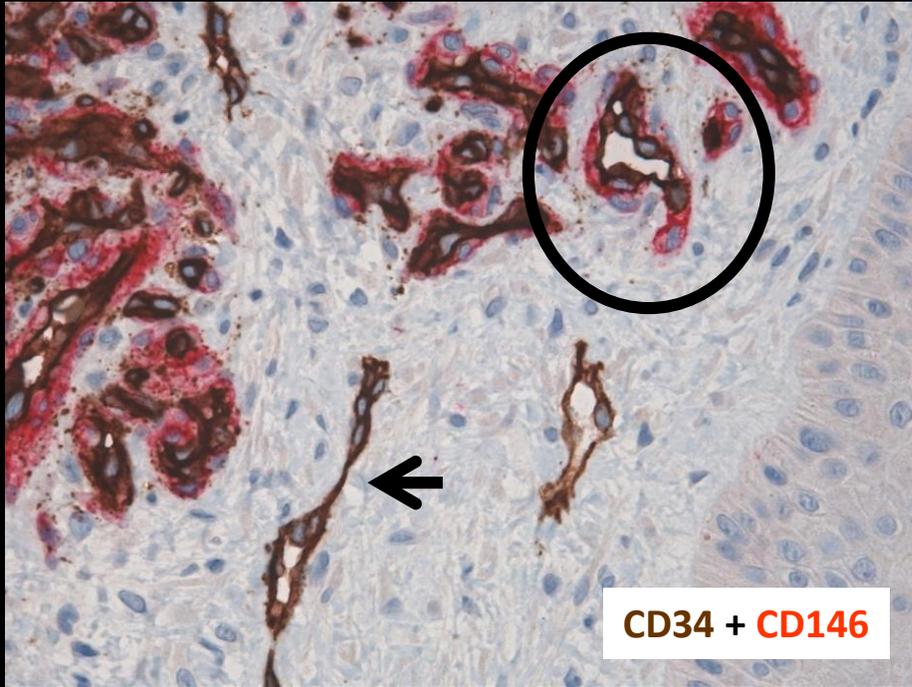

Note: No co-localization of either endothelium or smooth muscles (arrows)

Melanoma

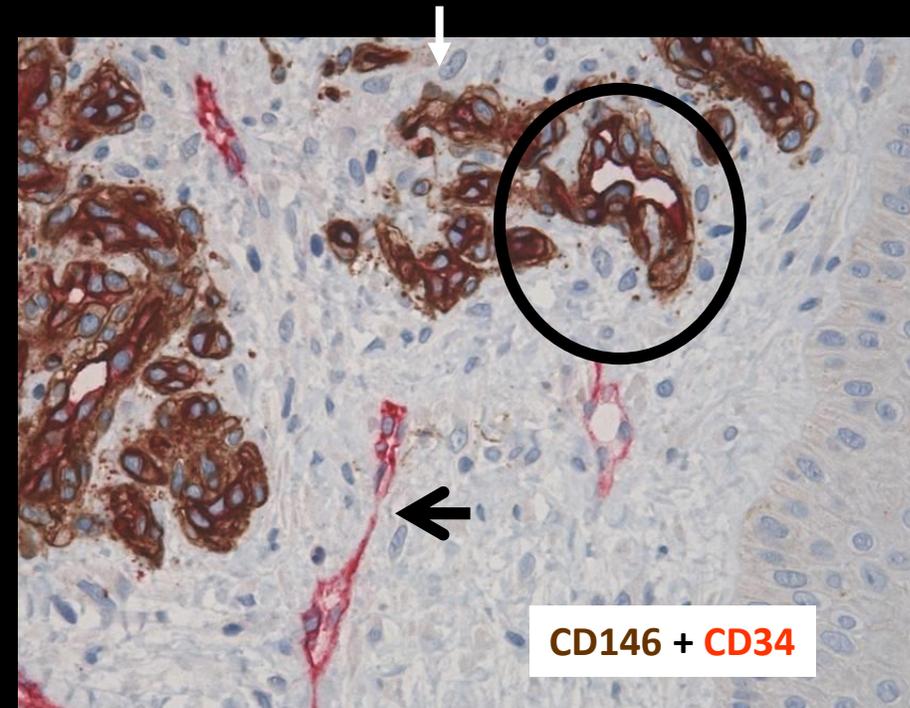

Double Immuno-staining – reversal stainings

CD34 (QBEND 10) + CD146 (EPR3208)

The order of primary antibodies

The brown deposit (DAB) from the first set of immuno-reagents hinder the second set of immuno-reagents (the red subsequent staining – compare the two images).

Endothelia cells are “double brown positive” /co-localization

Non of the combinations are useful ?

Hemangioma

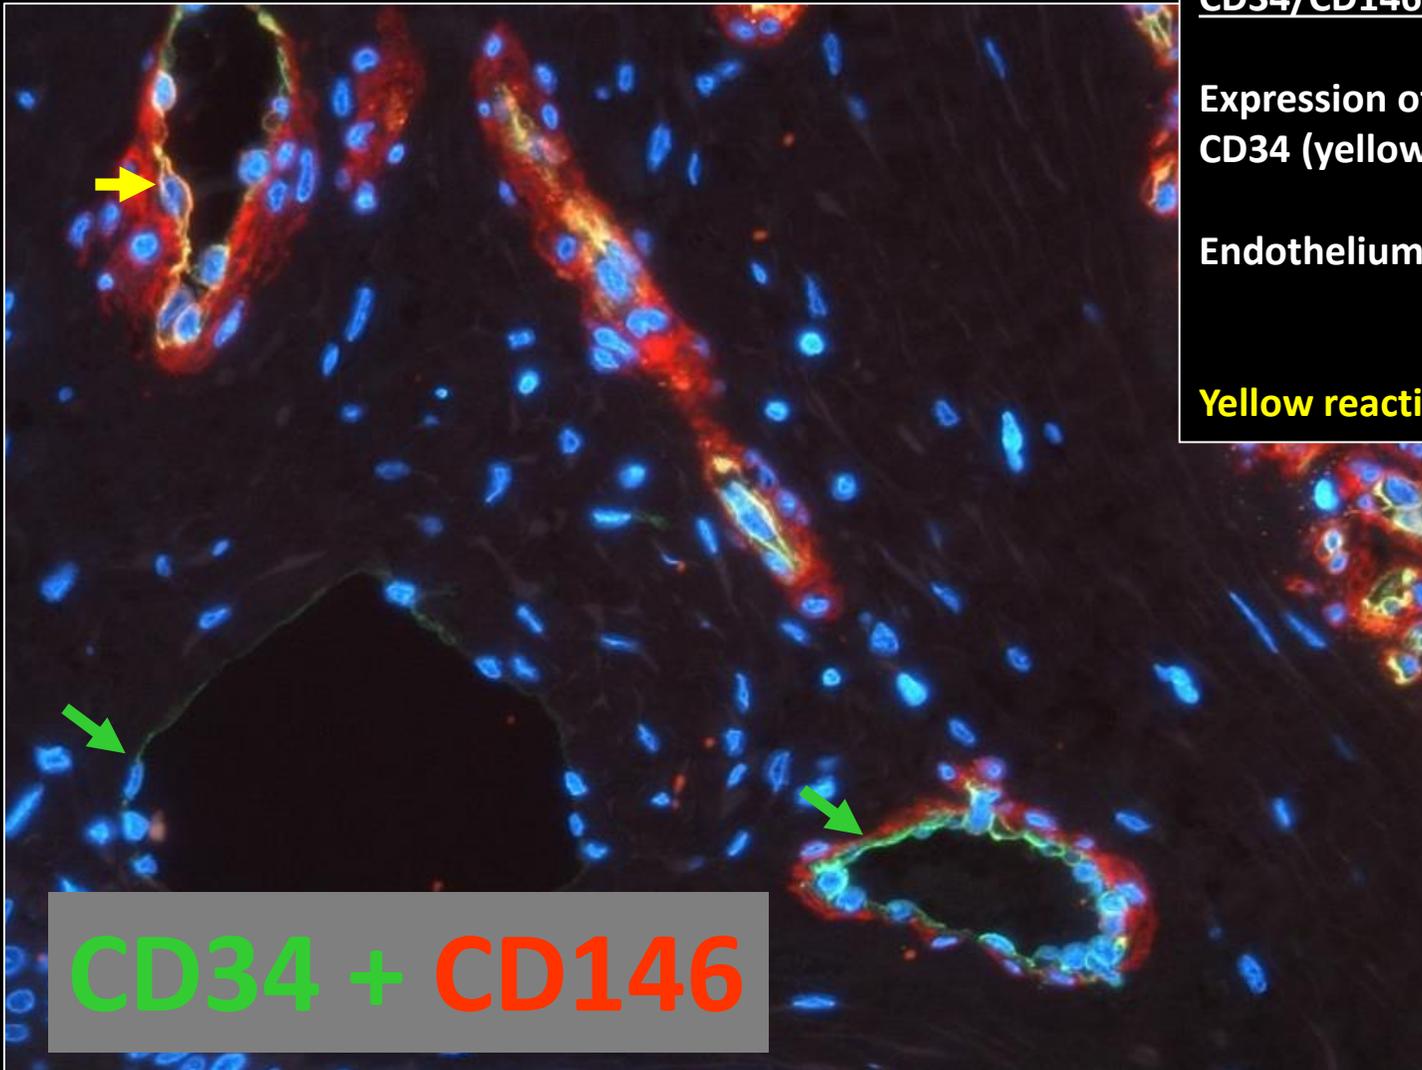

Double immunofluorescence staining of vascular structures

CD34/CD146 combination

Expression of CD146 in endothelium and co-localization with CD34 (yellow arrow)

Endothelium without expression of CD146 (green arrow)

Yellow reaction product = co-localized antigens

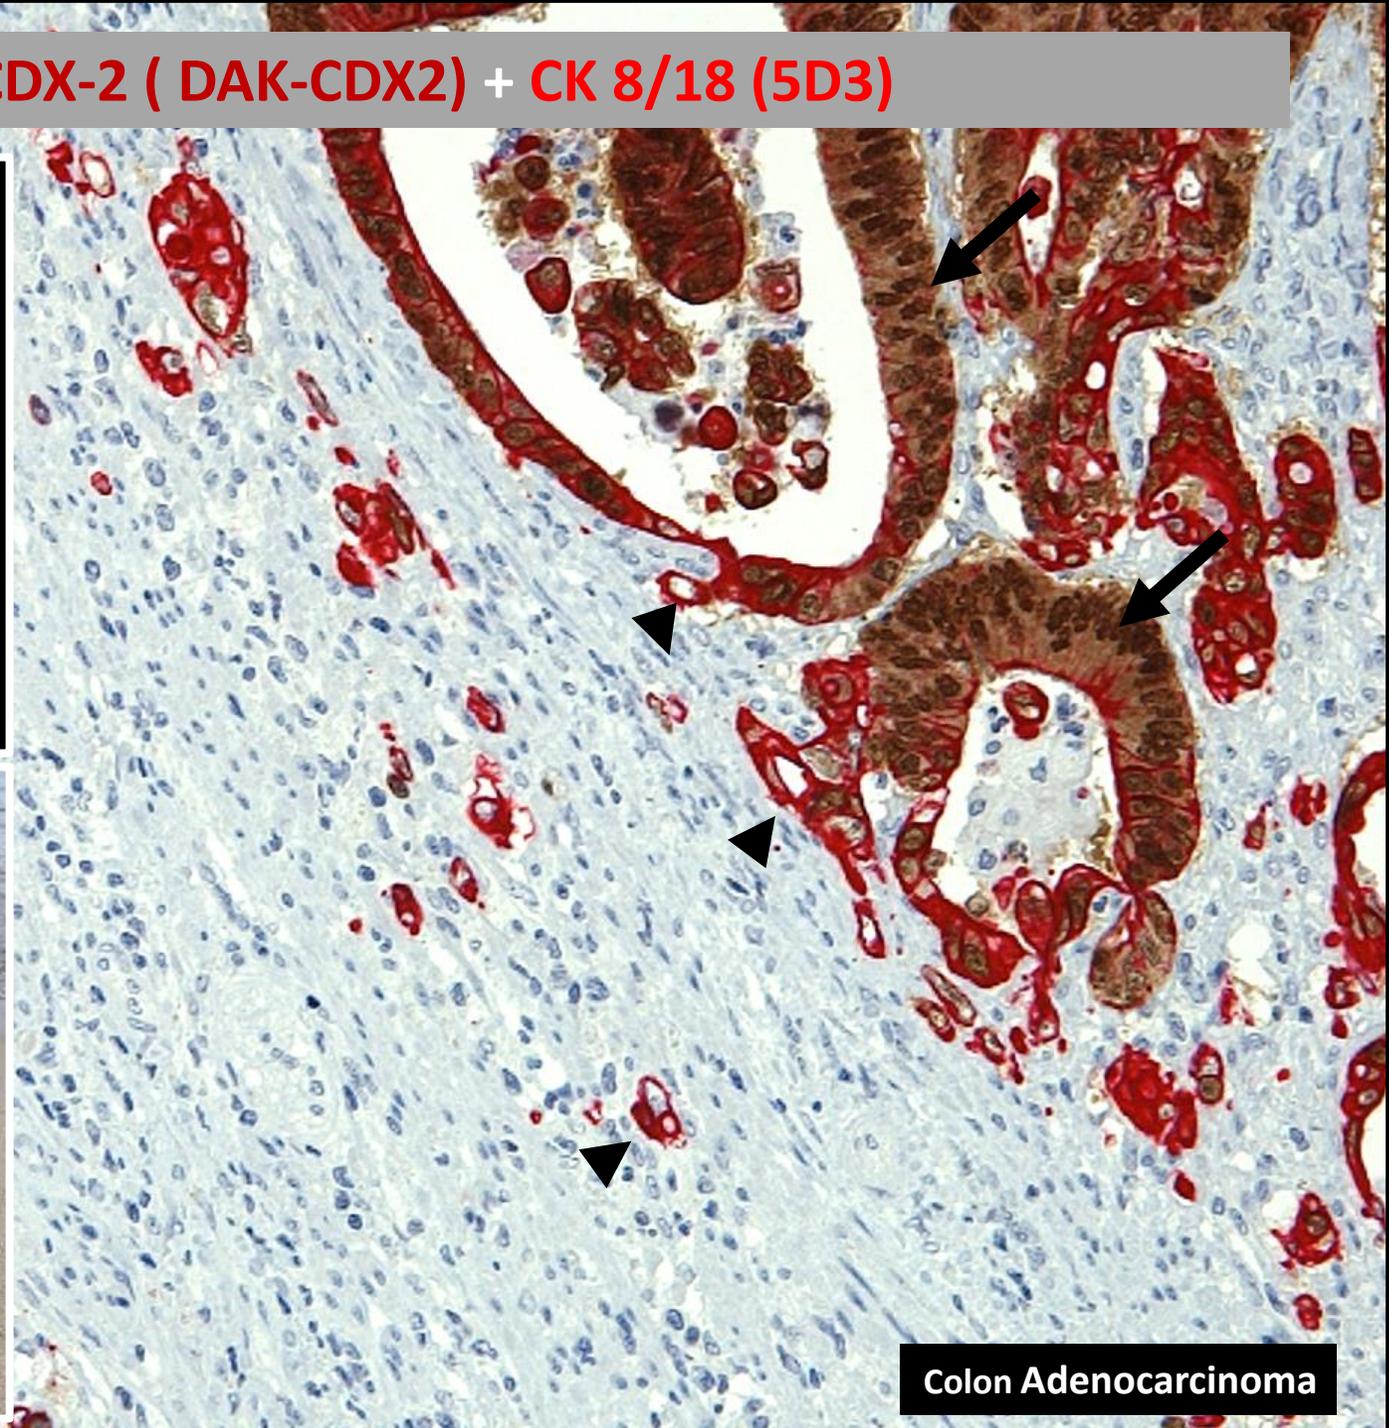

Hemangioma

CDX-2 (DAK-CDX2) + CK 8/18 (5D3)

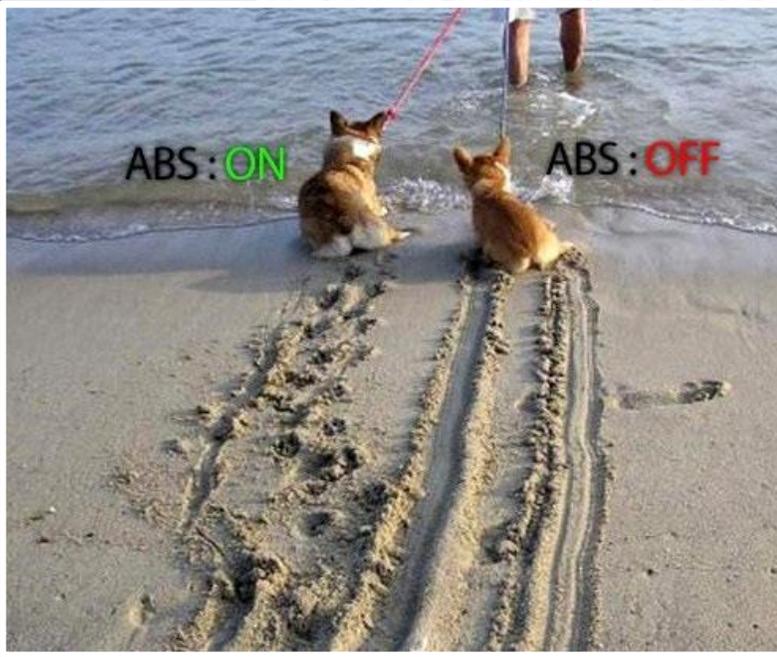

Problems ?

The DAB deposit may cause problems as it may block for the next set of immuno-reagents - arrows.

Tumor cells with infiltrative growth pattern (buddings) show expression of CK 8/18 due to downregulation of CDX2 – arrowheads.

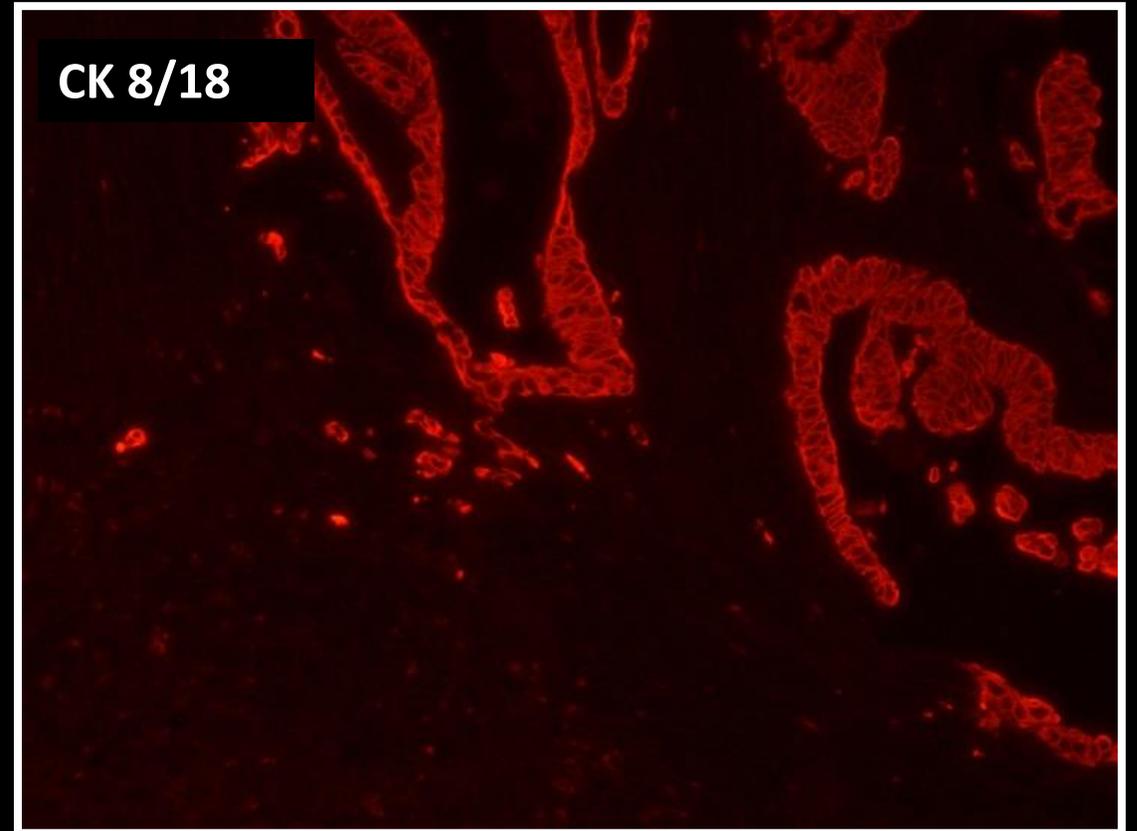

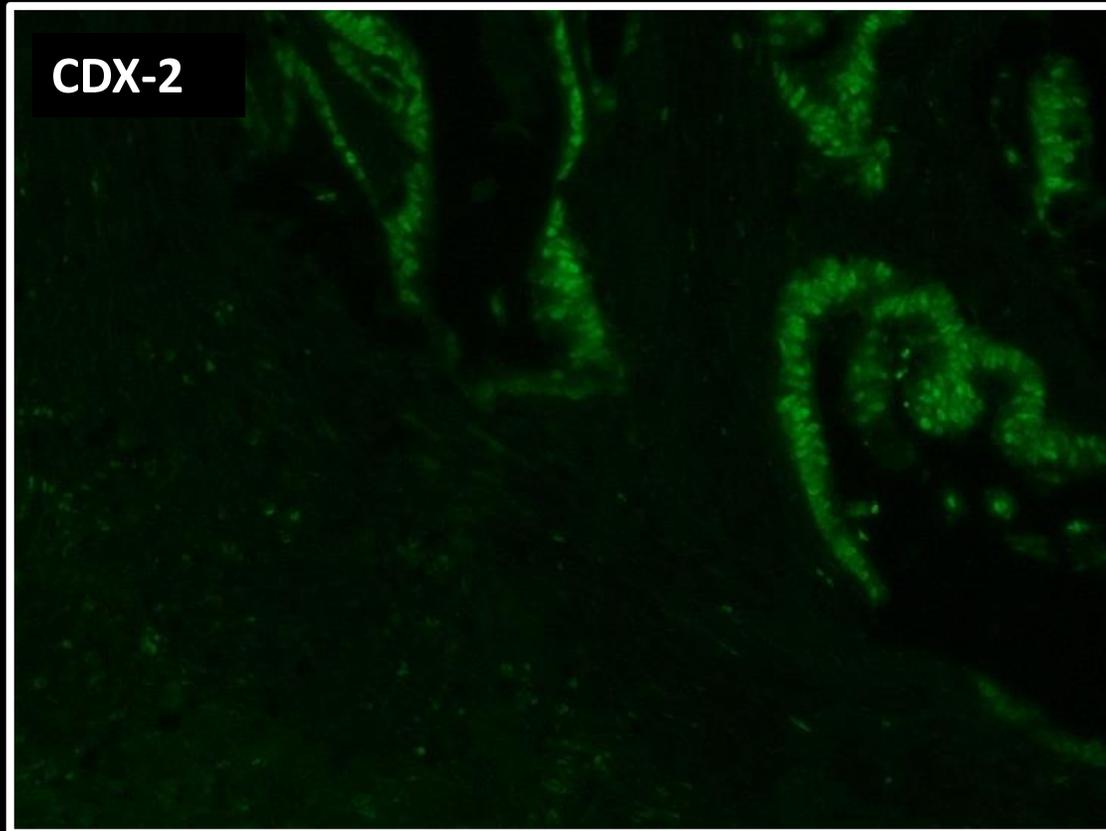

Colon Adenocarcinoma

CDX-2 (EP25) + CK 8/18 (5D3)

Double Staining-IF (simultaneous technique)

Colon Adenocarcinoma

Note expression of CK 8/18 in all tumor cells

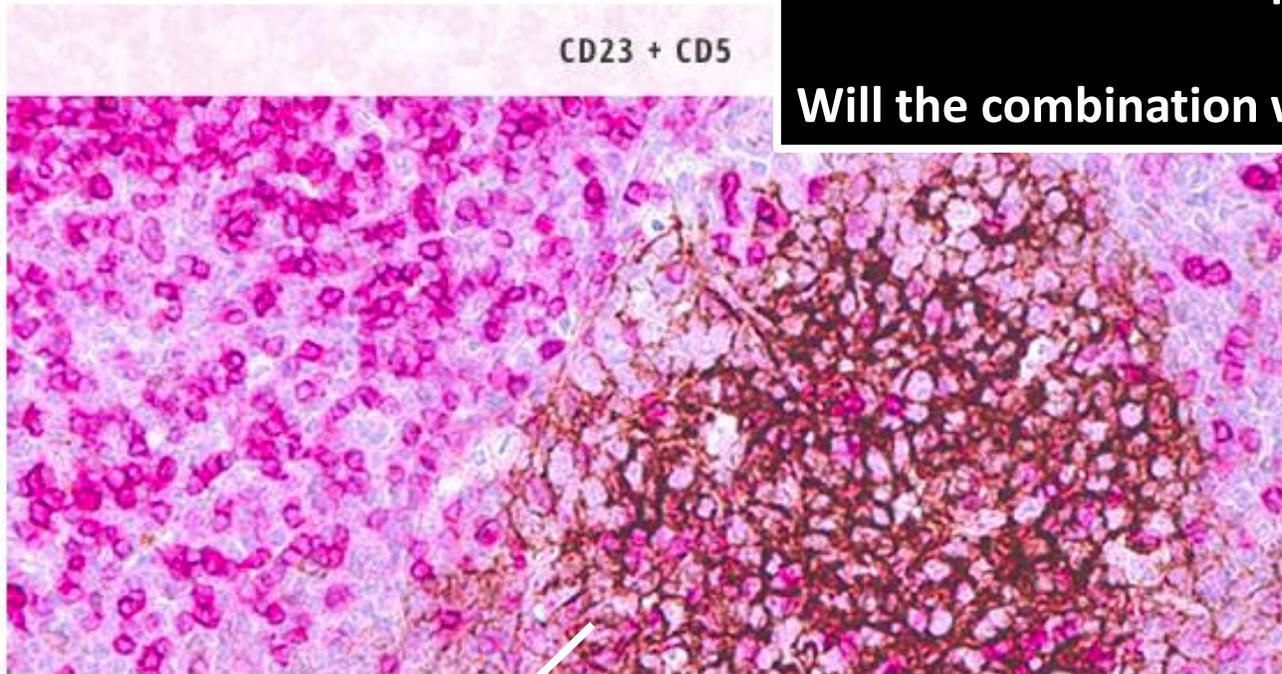

Be critical selecting antibody pair combinations:

Questions to be answered:

Will the combination provide the information that is needed ?

Will the combination work from a technical point of view ?

Co-localization in CLL ? The DAB deposit (CD23) shields for demonstration of the second antigen of interest (CD5)

Multiplex staining using sequential technique (Immuno-enzymatic)

Sequential procedure (Three markers/2xHRP+AP):

Pre-treatment (Antigen Retrieval)

First primary Ab (20 min).

Detection with Quanto/HRP (10+10 min).

Visualization with EnZMet (5 min).

Second primary Ab (same or different host, Ig-type or subclass) (20 min).

Detection with Quanto/HRP (10+10 min).

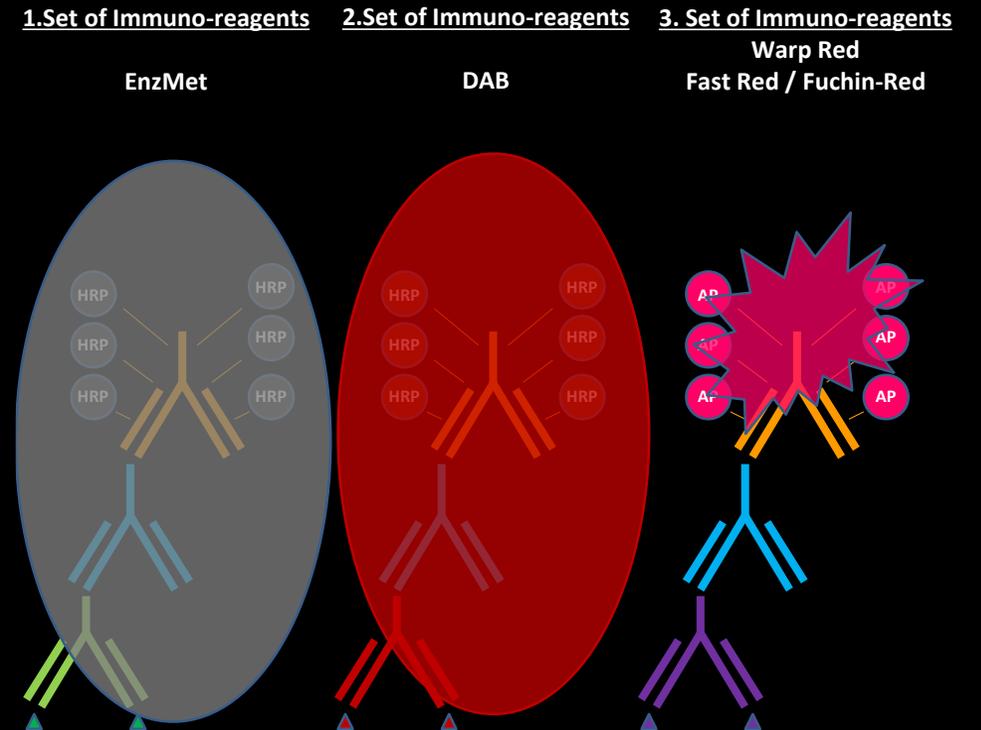

Visualization with DAB (7min).

Third primary Ab (same or different host, Ig-type or subclass) (20 min).

Detection with Hi-Def /AP (10+10 min).

Visualization with Warp Red (Fuchin-Red) (7min).

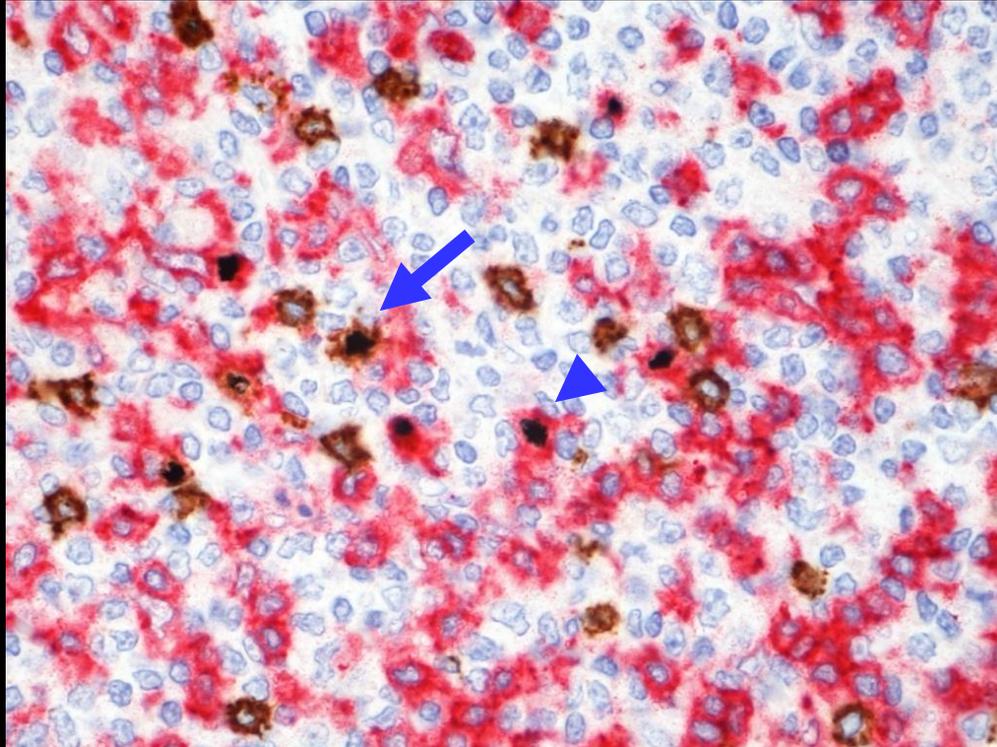

Counterstain, dehydration and mounting.

EnzMet (silver) and DAB deposit (after 1. and 2. set of immuno-reagents) shields for un-wanted reactivity with the following primary antibodies and/or detection reagents.

Multiplex staining using sequential technique (Immuno-enzymatic)

FoxP3, 236/E7 + CD8, C8/144B + CD4, EPR6855 (Mab x2 + Rab)

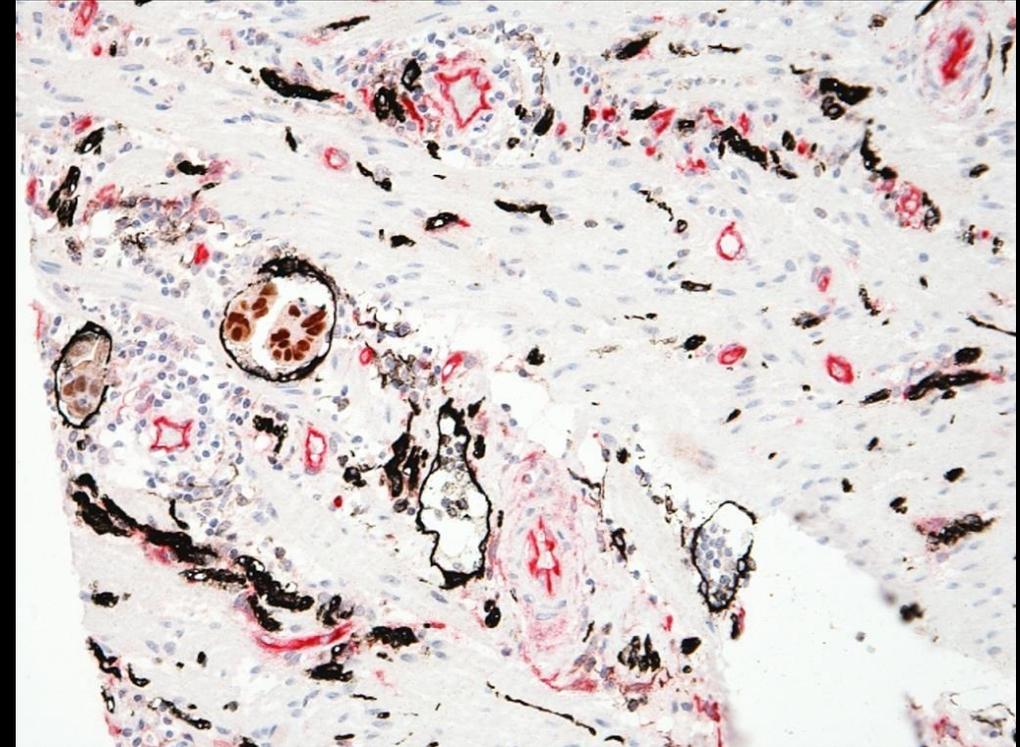

Tonsil

FoxP3 (black nuclear staining)

CD8 (brown membranous/cytoplasmic staining, arrow)

CD4 (red membranous/cytoplasmic staining, arrow-head)

Podo, D2-40 + CDX-2, DAK-CDX2 + CD34, QBEND10 (Mab x3)

Adenocarcinoma colon:

D2-40 (black lymph-endotheliale staining)

CDX-2 (brown nuclear staining of the tumor cells)

CD34 (red membranous endotheliale staining)

Multiplex (Melanoma)

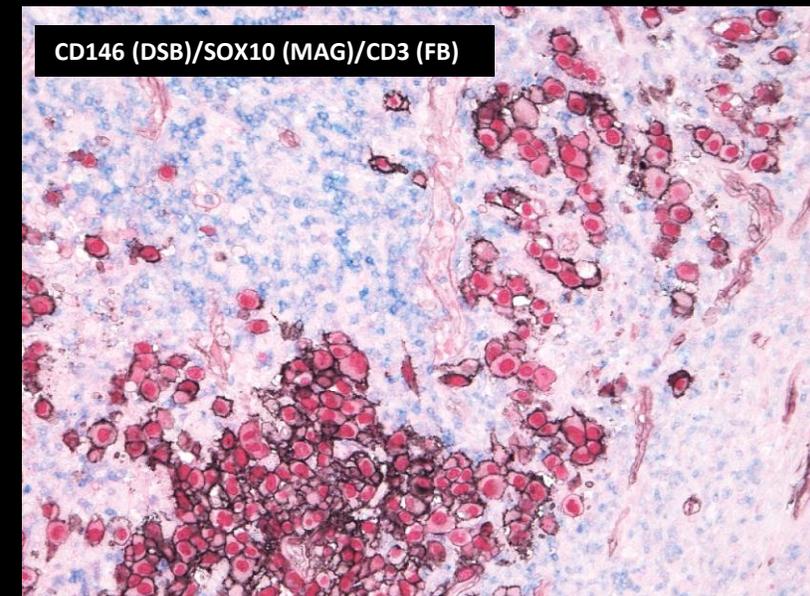

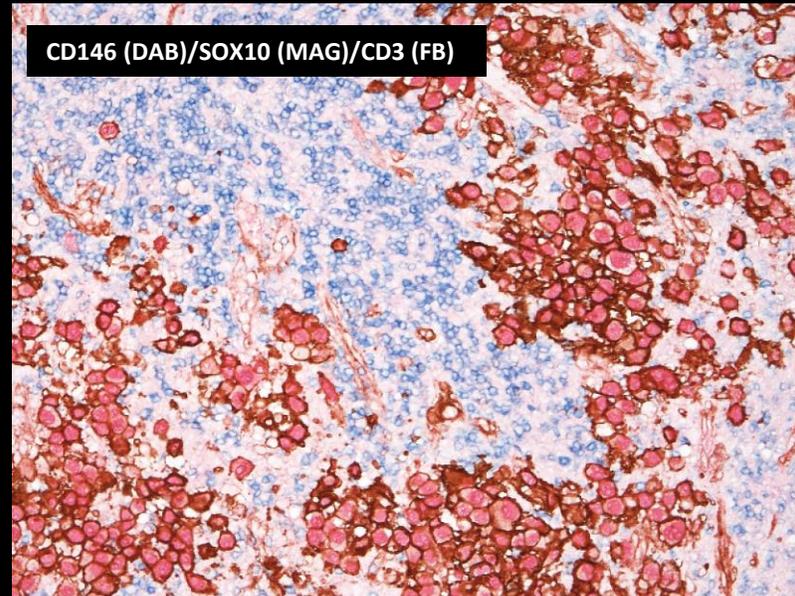

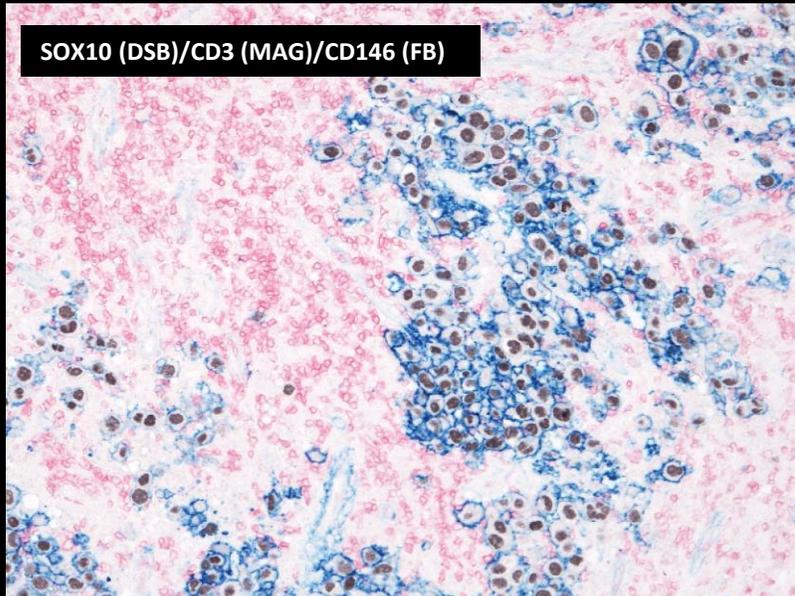

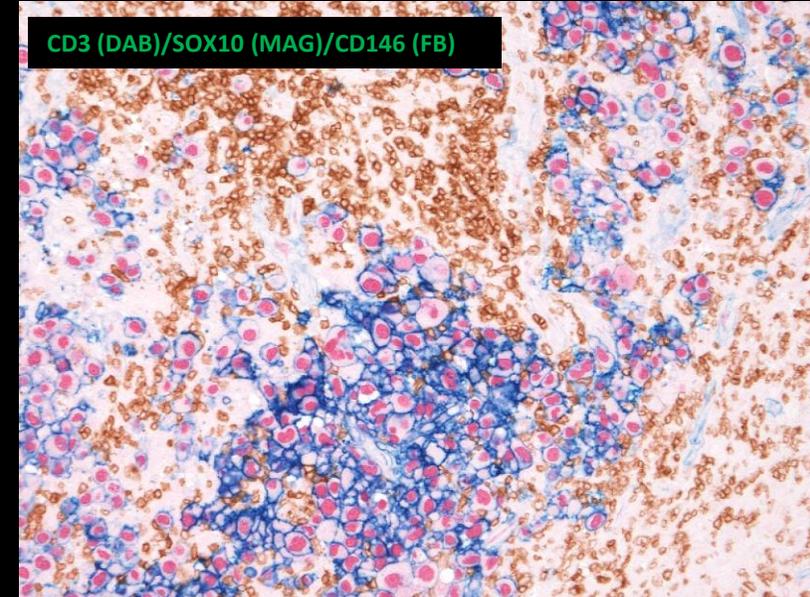

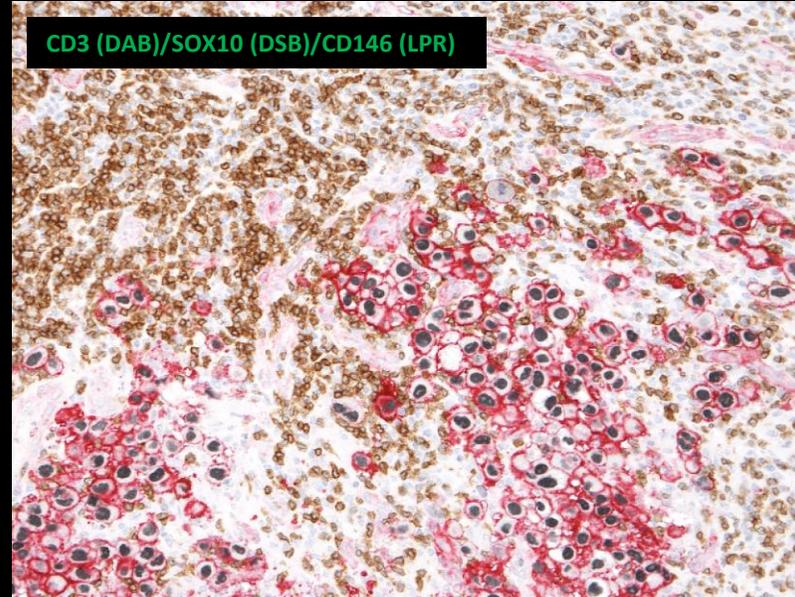

Combinations and color contrast

SOX10/CD146/CD3

HIER High pH (90°C/60min)

Flex+/MACH2-DS2

Always DAB-based chromogen in the first sequence

Multiplex staining using sequential technique (Immuno-enzymatic)

Now, what if unexpected color mixing occur (cross reactivity with the prior sets of immuno-reagents) ?

Mainly a problem related to other than DAB or DAB based chromogens

Inactivation of the prior set of immuno-reagents :

- Elution methods (High salt, extreme pH values and strong oxidizing agents)
- Blocking using Heat (97°C-100°C) in standard Citrate buffer pH6
- Combination of both ?

Applied between the individual sequences in the multiplex technique

ARTICLE

Antibody Elution Method for Multiple Immunohistochemistry on Primary Antibodies Raised in the Same Species and of the Same Subtype

Daniel Pirici, Laurentiu Mogoanta, Samir Kumar-Singh, Ionica Pirici, Claudiu Margaritescu, Cristina Simionescu, and Radu Stanescu

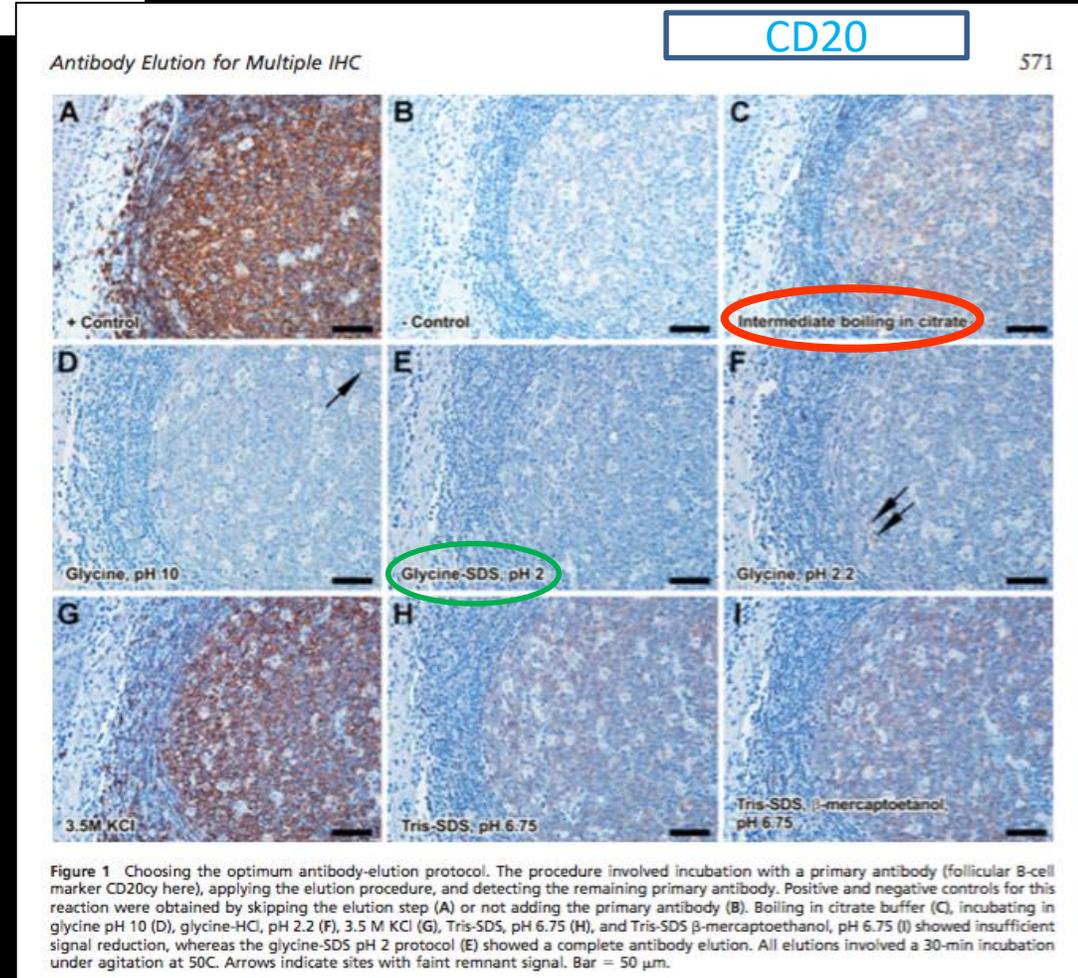

Control studies

Demonstrated that:

Elution, using a glycine SDS pH 2 solution, of the antibodies after the first round of immunolabelling was superior in regard of eliminate cross reactivity with the second set of immuno-reagents compared to other methods tested .

This also includes an intermediate HIER step using Citrate pH6

Limitations: High affinity antibodies may be difficult to elute – we have to validate (include proper controls) the efficiency of the chosen blocking procedure optimizing the multiplex procedures

Technical Note

A Novel, Simple, Reliable, and Sensitive Method for Multiple Immunoenzyme Staining: Use of Microwave Oven Heating to Block Antibody Crossreactivity and Retrieve Antigens

HUI Y. LAN,¹ WEI MU, DAVID J. NIKOLIC-PATERSON, and ROBERT C. ATKINS

Department of Nephrology, Monash Medical Centre, Clayton, Victoria, Australia.

Received for publication May 16, 1994 and in revised form August 23, 1994; accepted September 29, 1994 (4T3389).

Blocking buffer: 0.01 M sodium citrate buffer, pH 6.0.

Efficient blocking temperature of 100°C

Efficient blocking time 2x5 min.

ORIGINAL PAPER

D. Tornehave · D.M. Hougaard · L.-I. Larsson

Microwaving for double indirect immunofluorescence with primary antibodies from the same species and for staining of mouse tissues with mouse monoclonal antibodies

Blocking buffer: 0.01 M sodium citrate buffer, pH 6.0.

Successful double staining of a number of antigens was achieved by a standard 3×5-min microwaving at 780 W. This time may not necessarily apply to other ovens, antibody combinations or buffers used.

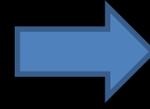

Heat deactivation step between sequences in the staining protocol - Limitations:

Require Heat stable chromogens - DAB, VBlue, VRed and LPR (Dako)

For certain antigen/antibody reaction not always efficient

Multiplex staining techniques (IHC)

Are antigens of interest located in the same cellular compartment (e.g. the cytoplasm) ?

NO

Use a immuno-enzymatic DAB based sequential or simultaneous technique

YES

Double/Multiplex immunofluorescence technique (simultaneous technique)

Double/Multiplex immuno-enzymatic technique (simultaneous technique / sequential technique)

A reversed applications of the primary antibodies (sequential technique)

SIMPLE technique (Sequential Immunoperoxidase Labelling and Erasing Method)

Double enzymatic staining using simultaneous technique

Pre-treatment (Antigen Retrieval)

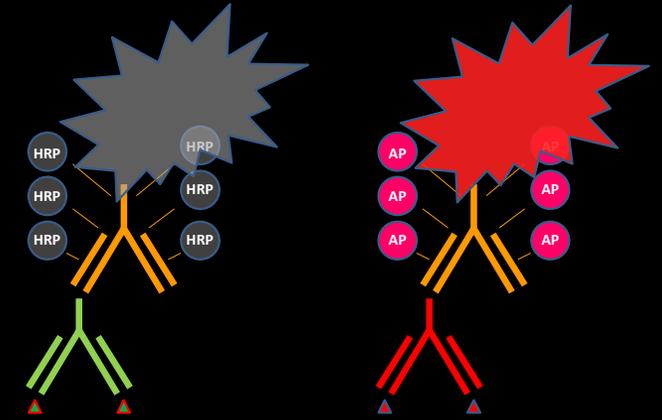

Incubation with mix of primary Abs (Rab+Mab)

Incubation with polymer/multimer mix (anti-Mab/HRP + anti-Rab/AP)

Incubation with HRP substrate (e.g. , HiDef Yellow, Magenta, DAB or DSB)

Incubation with AP substrate (e.g. , Permanent Red, Fast Red or Warp Red)

Counter stain, mounting and microscopy

A primary antibody cocktail is applied to the tissue at the same time (simultaneously)

Primary antibodies must be of different host (e.g., mouse and rabbit) or at least different Ig-types, subclass or one primary Ab with a conjugate (e.g., FITC).

Reactions are detected with a mix of secondary antibodies conjugated with two different enzymes (e.g., HRP and AP) and applied to the tissue at the same time (simultaneously).

To prevent cross-reaction between secondary antibodies raised against different species, it is recommended to apply second-step antibodies raised in the same host – if not possible, use pre-absorbed secondary antibodies.

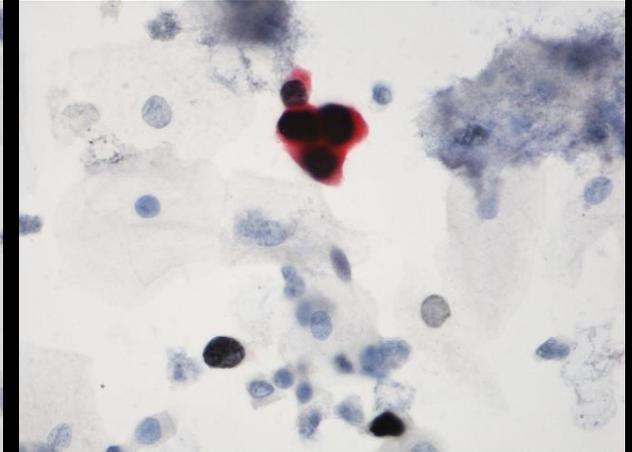

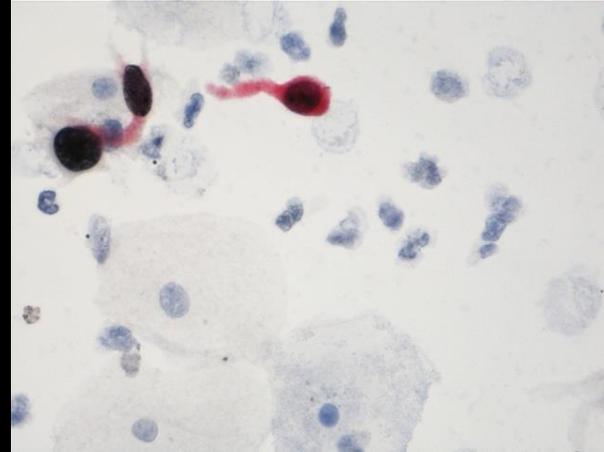

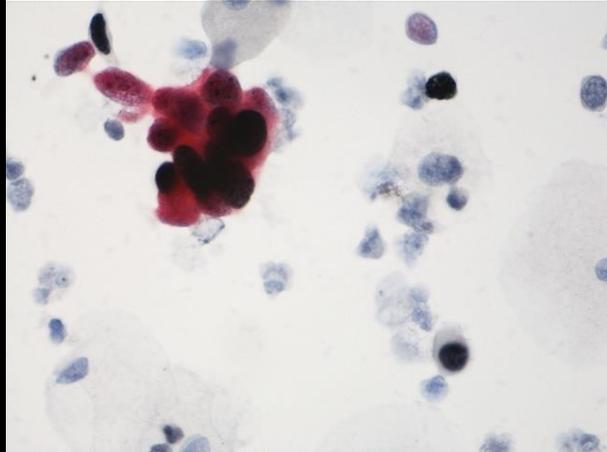

Each antibody: antigen reaction will yield a specific color of staining that can be easily identified.

Simultaneous double staining : Ki-67, SP6 (1:25) + P16, E6H4 (RTU)

Dysplasia / Cervix (Cytology)

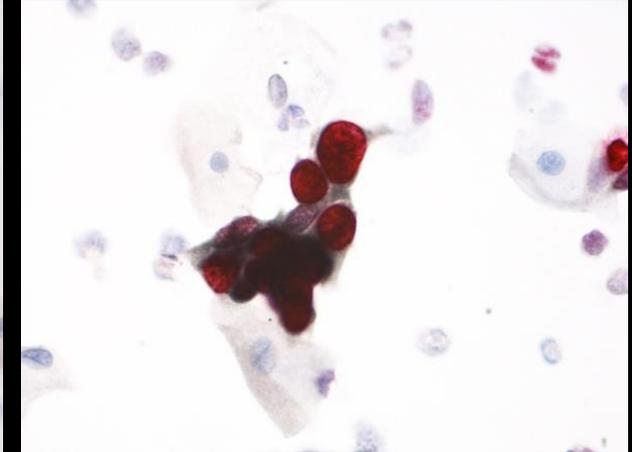

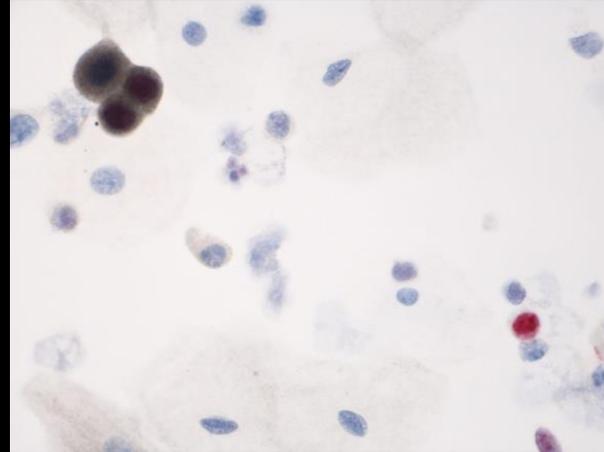

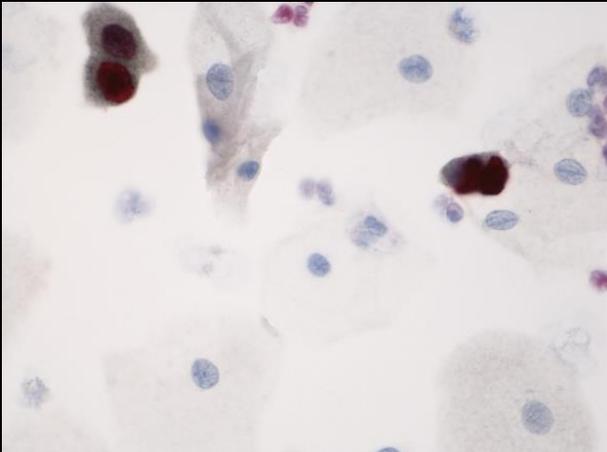

Double Stain 1
(Biocare)

Anti-Rab/HRP
Anti-Mab/AP

Double Stain 2
(Biocare)

Anti-Rab/AP
Anti-Mab/HRP

Cytological specimens fixed in NBF 30' → 96 alk. 10' → Wash buffer → HIER/TE 20'

Multiplex staining techniques (IHC)

Are antigens of interest located in the same cellular compartment (e.g., the cytoplasm) ?

NO

Use a immuno-enzymatic DAB based sequential or a simultaneous technique

YES

Double/Multiplex immunofluorescence technique (simultaneous/sequential technique)

Double immuno-enzymatic technique (simultaneous technique / sequential technique)

A reversed applications of the primary antibodies (sequential technique)

SIMPLE technique (Sequential Immunoperoxidase Labelling and Erasing Method)

Routine methods ?

Co-localized signal using double immuno-enzymatic techniques ?

Only a few chromogen combinations fulfill the criteria of a good visual contrast between the basic colors and a good contrasting mixed color at sites of co-localized antigens:

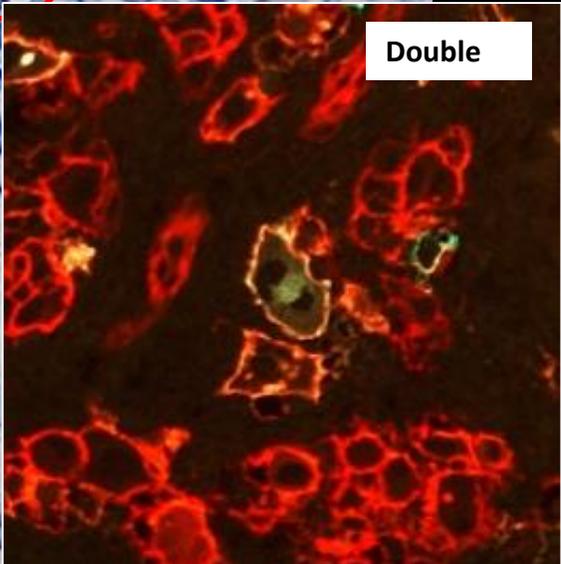

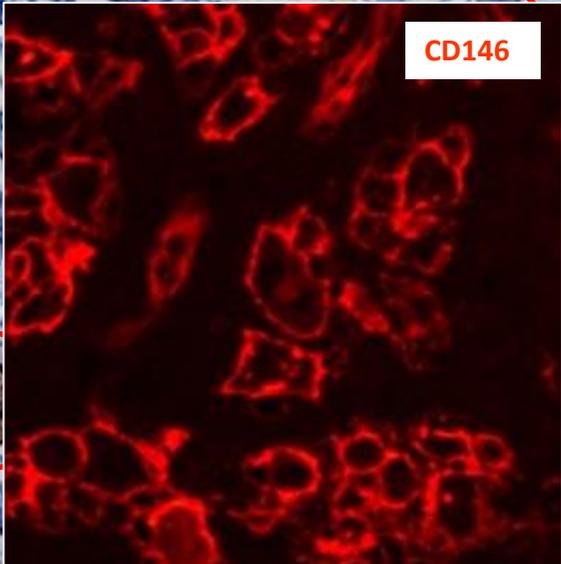

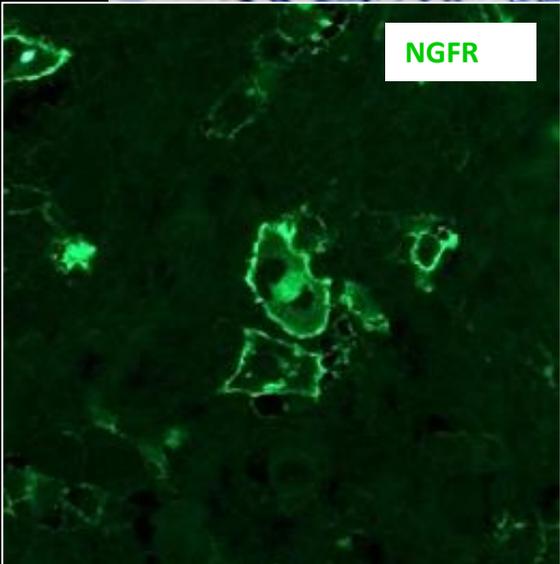

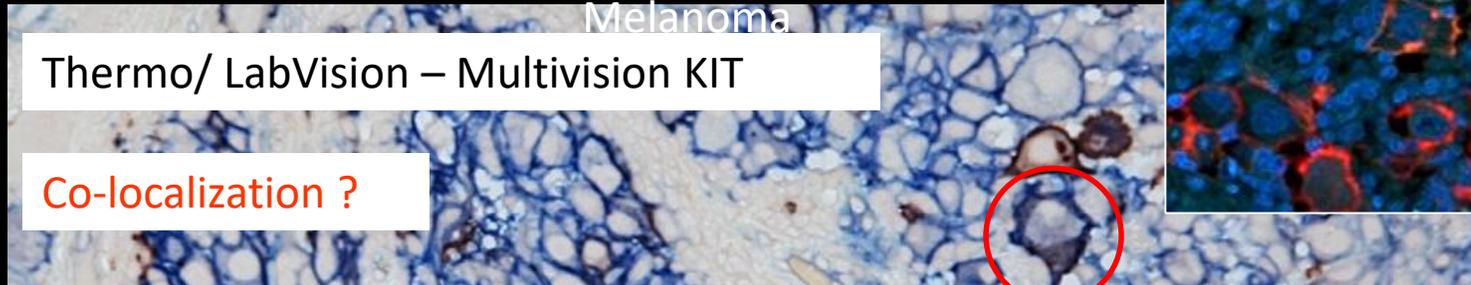

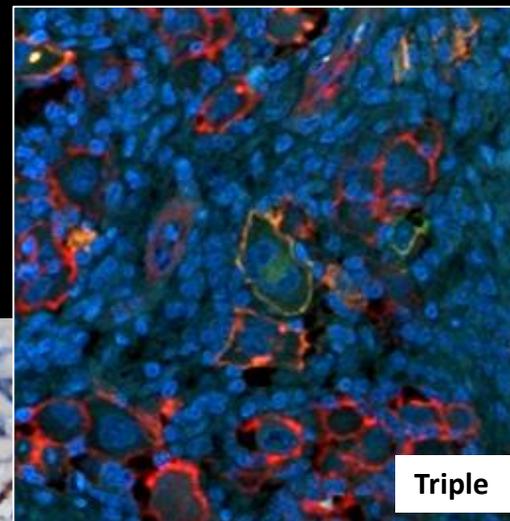

- ❑ **Red–blue combination, composed of HRP activity visualized with amino-ethyl carbazole (AEC) and alkaline phosphatase (AP) activity visualized with naphthol- AS-MX-phosphate/Fast Blue BB**
- ❑ **Vector NovaRed (Vector Laboratories) and Vector Blue (VBlue) for HRP and AP activities, respectively (alternatively - MultiVision kit system for rabbit and mouse primaries including all chromogen reagents by Thermo Fisher Scientific (LabVision))**
- ❑ **Red–blue combination, composed of alkaline phosphatase (AP) activity visualized with VBlue and AP activity visualized with Liquid Permanent Red (Dako) – sequential technique with intermediary HIER step to block first set of immuno-reagents**
- ❑ **Red–turquoise color combination composed of AP and beta-galactosidase activities, respectively. (Compared with most HRP and AP reaction products, beta-galactosidase activity visualized by X-gal/ferro-ferri cyanide is relatively insensitive/inefficient and also quite diffusely localized - unprecise)**

SIMPLE: A Sequential Immunoperoxidase Labeling and Erasing Method

George Glass, Jason A. Papin, and James W. Mandell

Department of Biomedical Engineering, (GG,JAP) and Department of Pathology (Neuropathology) (JWM),
University of Virginia, Charlottesville, Virginia

Table 1 Comparison of SIMPLE with existing multiprobe immunolabeling methods

	SIMPLE	Traditional multi-chromagen IHC	Multiplex-immunostain chip	Multicolor IF
Maximum labels per section	5+	2–3	50	3
Use on paraffin-embedded archival tissue	+	+	+	–/+
Ability to overcome autofluorescence/photobleaching	+	+	+	–
Colocalization within a single cellular compartment	+	–	–	+
Compatible with primary antibodies from same species	+	–	+	–

SIMPLE is compared with traditional two- or three-color multichromagen immunohistochemistry (IHC), the multiplex immunostain chip method (Furuya et al. 2004), and multicolor immunofluorescence (IF) methods.

Simple technique : A relative new method which cannot only be used to demonstrate antigens located in different cellular compartments but also can be used to demonstrate co-localized antigen in the same cellular compartment.

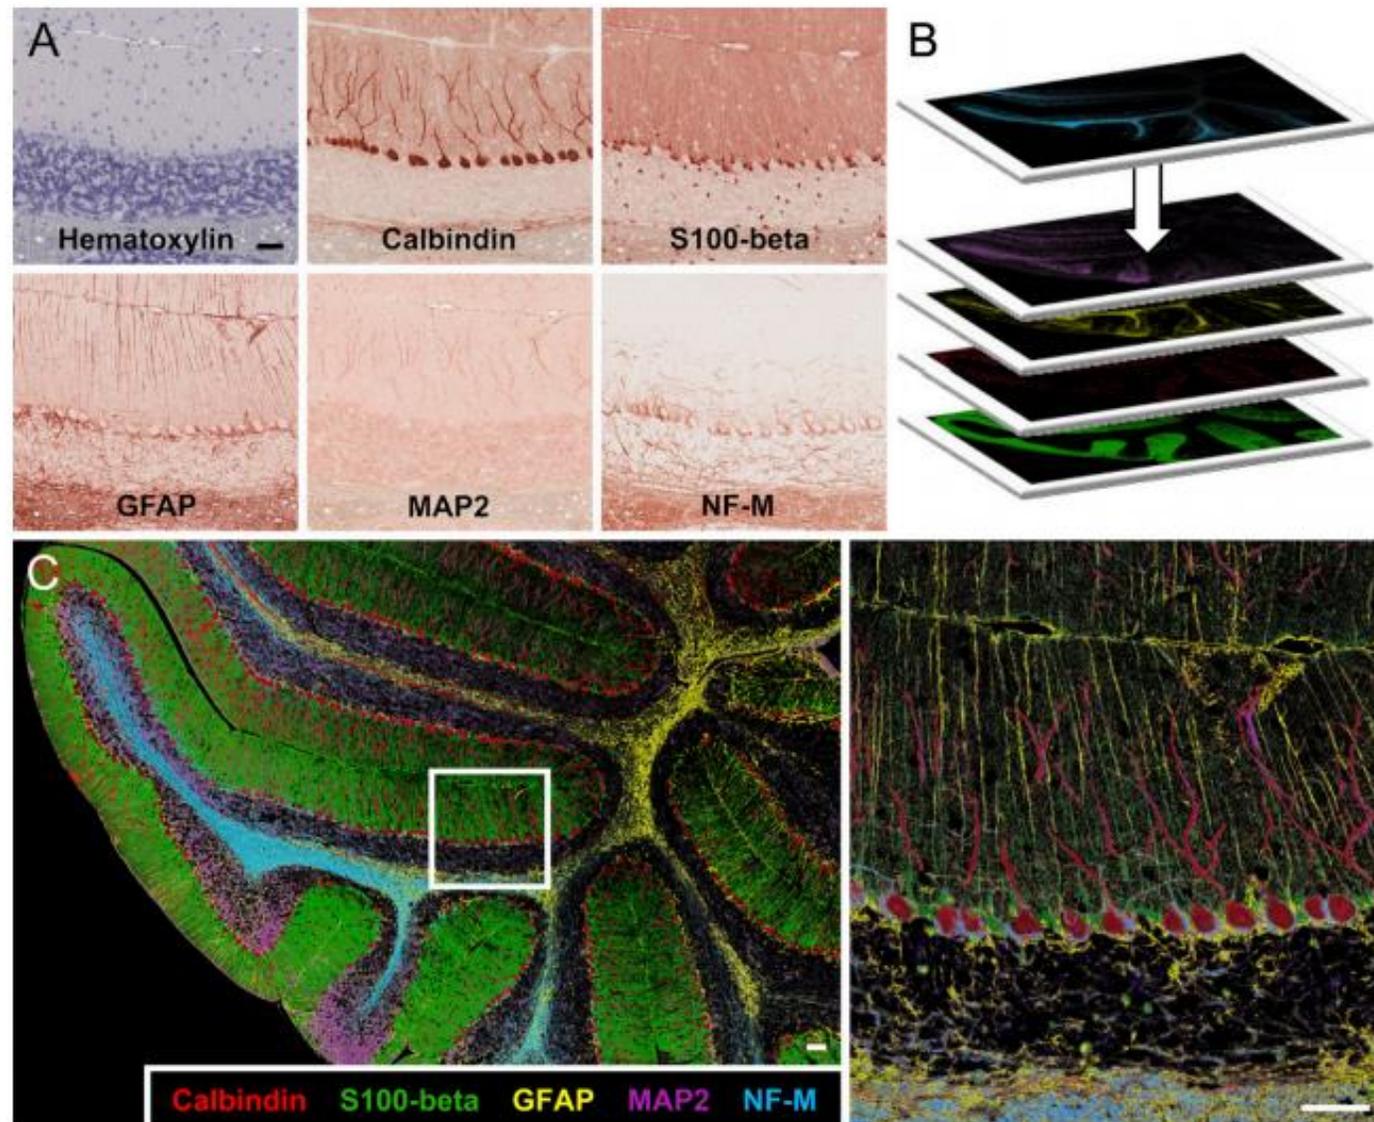

Figure 3 Simultaneous visualization of five antigens in mouse cerebellum. (A) Adult mouse brain was counterstained with hematoxylin, then sequentially probed with polyclonal antibodies to calbindin, S100- β , and GFAP, and monoclonal antibodies to MAP2 (AP18) and neurofilament (NF-M) 2H3. (B) The images were individually pseudocolored and overlaid. (C) The small boxed area in the left panel is shown magnified at right. The resultant image reveals the morphology of different cell types and fine details of interactions of Purkinje cells, Bergmann glia, astrocytes, and basket cell terminals that would not be obvious with single or dual labeling. Bar = 50 μ m.

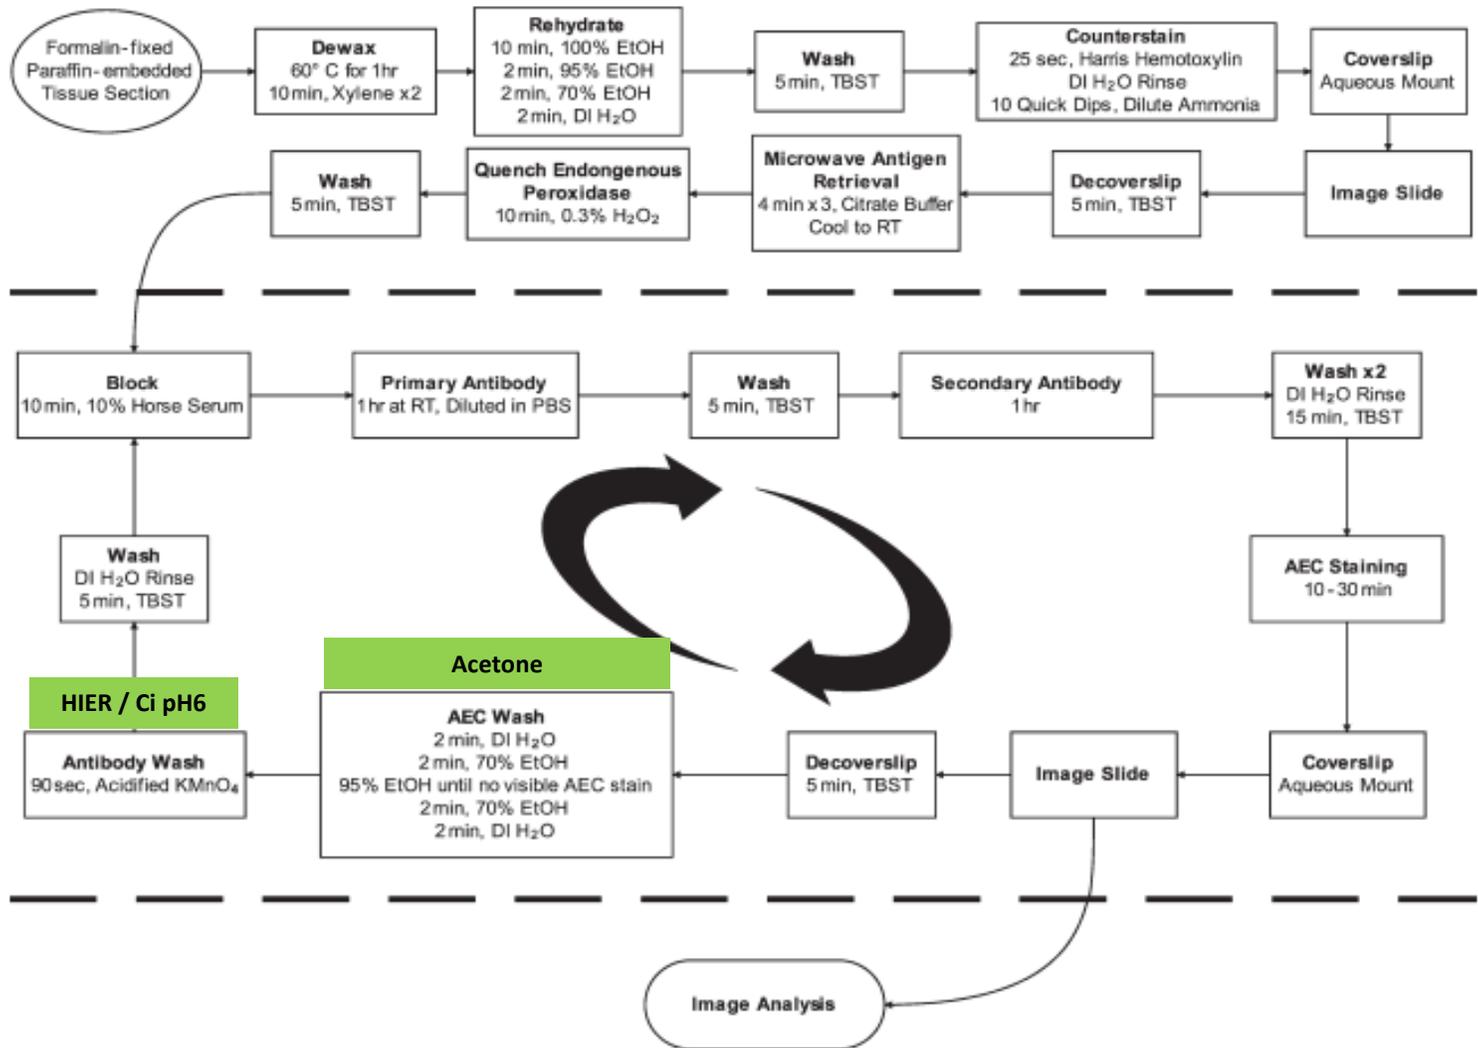

Figure 1 SIMPLE strategy. Formalin-fixed, paraffin-embedded sections are dewaxed, rehydrated, and counterstained before initial probing. Tissue is imaged and then subjected to antigen retrieval, removing the counterstain. Each staining round is conducted using standard immunohistochemical protocols with the alcohol-soluble red peroxidase substrate 3-amino-9-ethylcarbazole (AEC). After each round of staining, the tissue is imaged and then stripped of AEC precipitate in ethanol. Antibody is then eluted in acidified permanganate, and the tissue is subjected to the next round of staining.

Requirements

Chromogen that can be erased (AEC)

Aqueous mounting

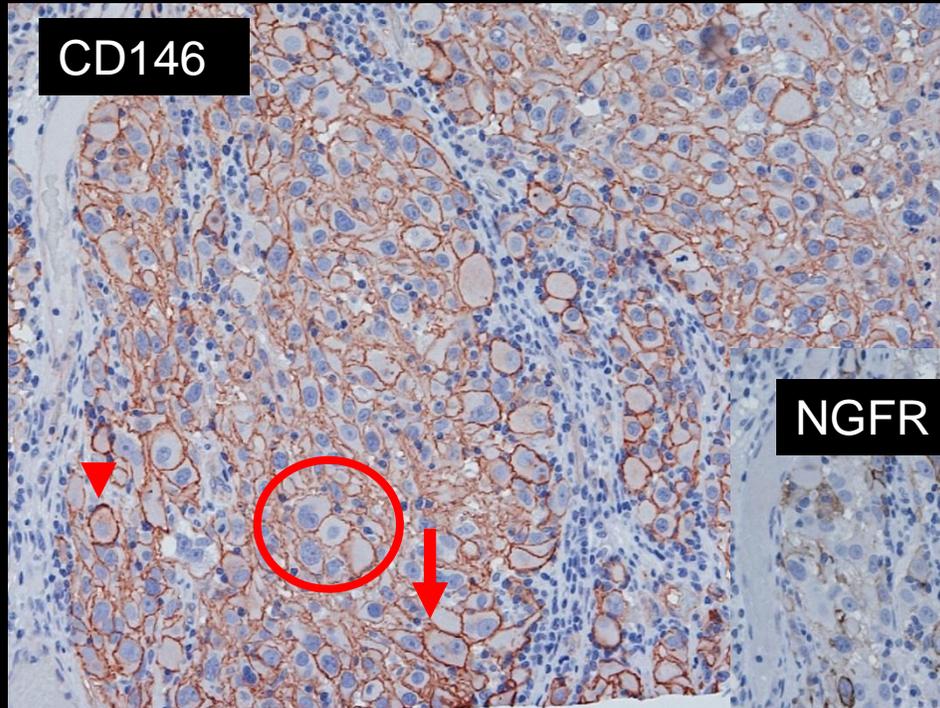

Imaging of slides

Removal of coverslip

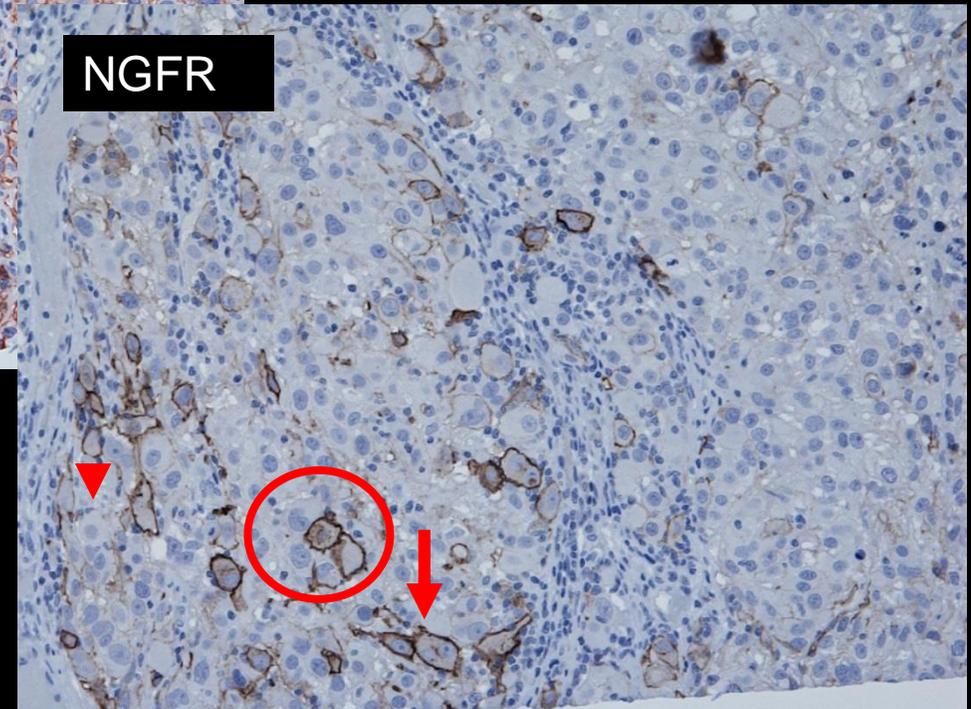

AEC wash reagent that is gentle to detection of the following epitopes of interest

Efficient blocking procedure for the immuno-reagents applied

SIMPLE technique: CD146 (EPR3208) + NGFR (MRQ21)

Super Sensitive (Biogenex)
Impact AEC (Vector Lab)

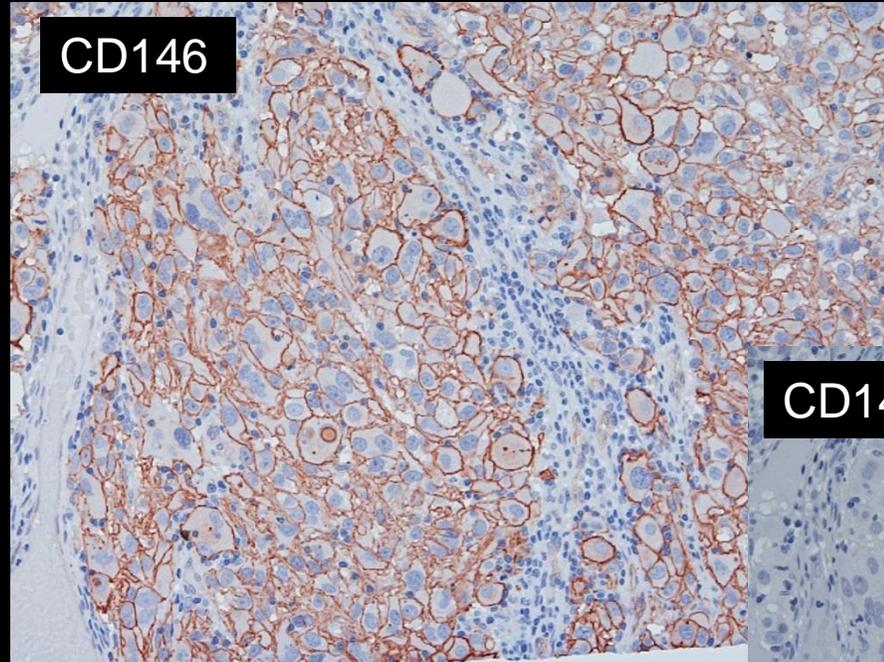

First sequence: CD146 immunostaining => AEC Impact => coverslip

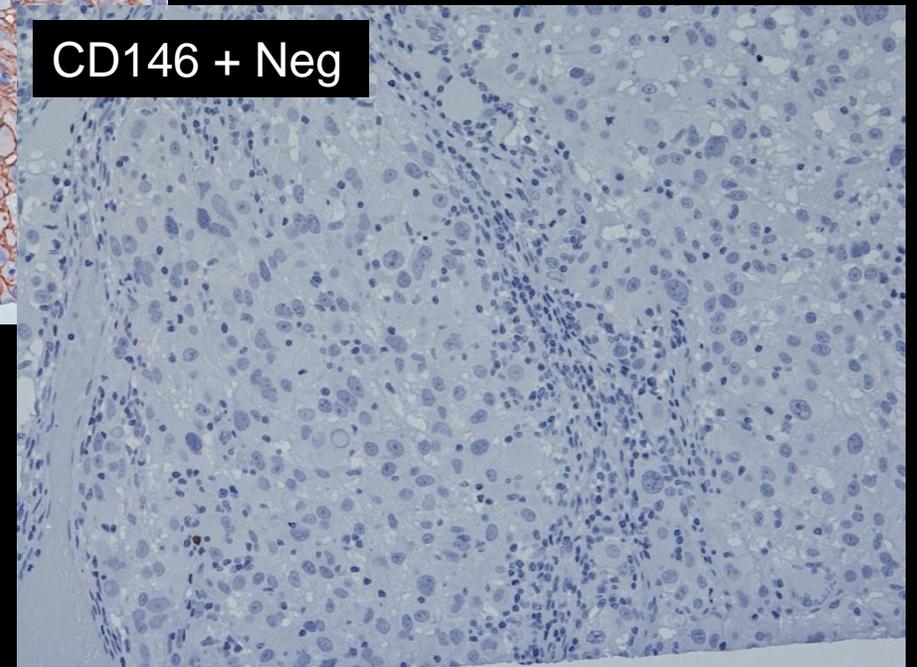

Imaging => de- coverslip => Erasing (Acetone) => Blocking using HIER (Ci)

Second sequence: NGFR immunostaining => DAB => coverslip

SIMPLE technique: CD146 (EPR3208) + Neg

Control

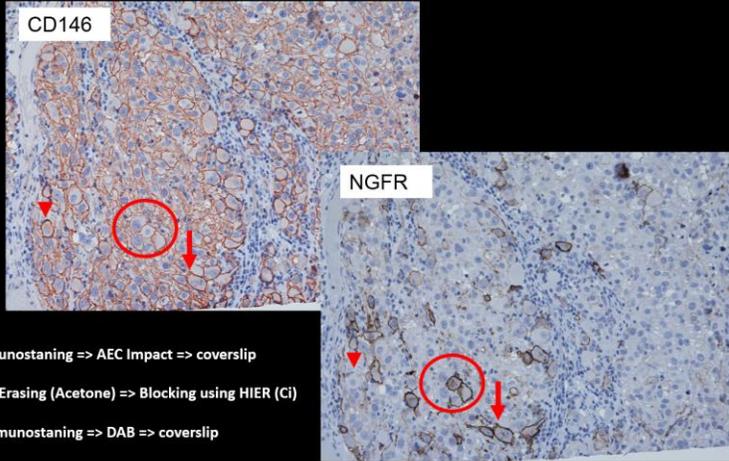

Control experiments:

First sequence: CD146 immunostaining => AEC Impact => coverslip

Imaging => decoverslip => Erasing (Acetone) => Blocking using HIER (Ci)

Second sequence: Omission of primary Ab => immunostaining => DAB => coverslip

SIMPLE technique: CD146 (EPR3208) + NGFR (MRQ21)

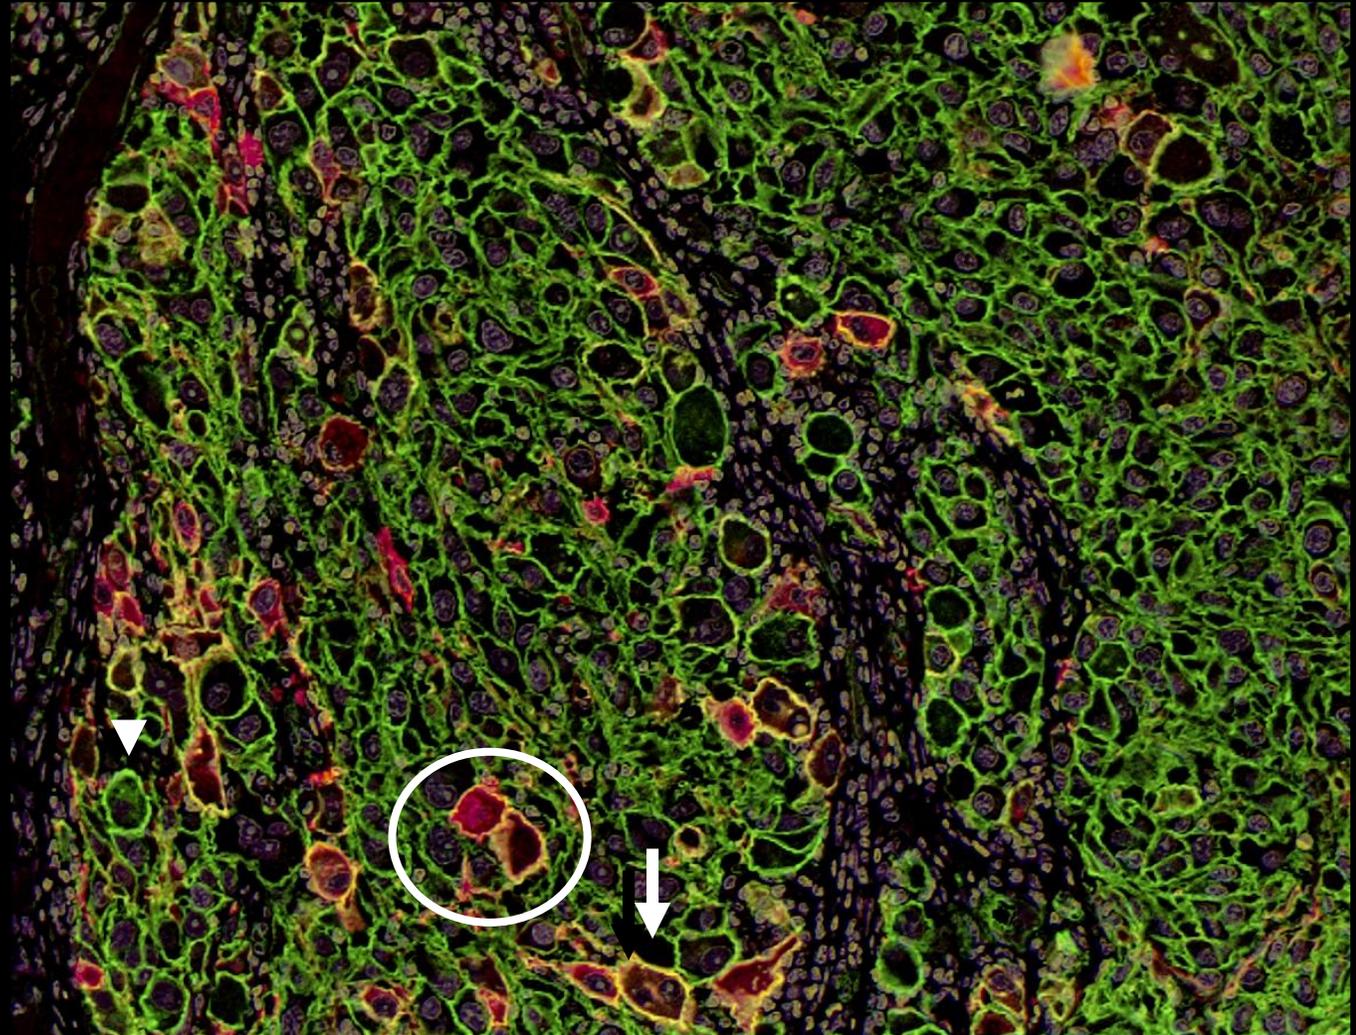

First sequence: CD146 immunostaining => AEC Impact => coverslip
Imaging => de- coverslip => Erasing (Acetone) => Blocking using HIER (Ci)

CD8 RUO	1:100	Rabbit	SP239	Membrane	1:100	Spring Bioscience, cat # M5394

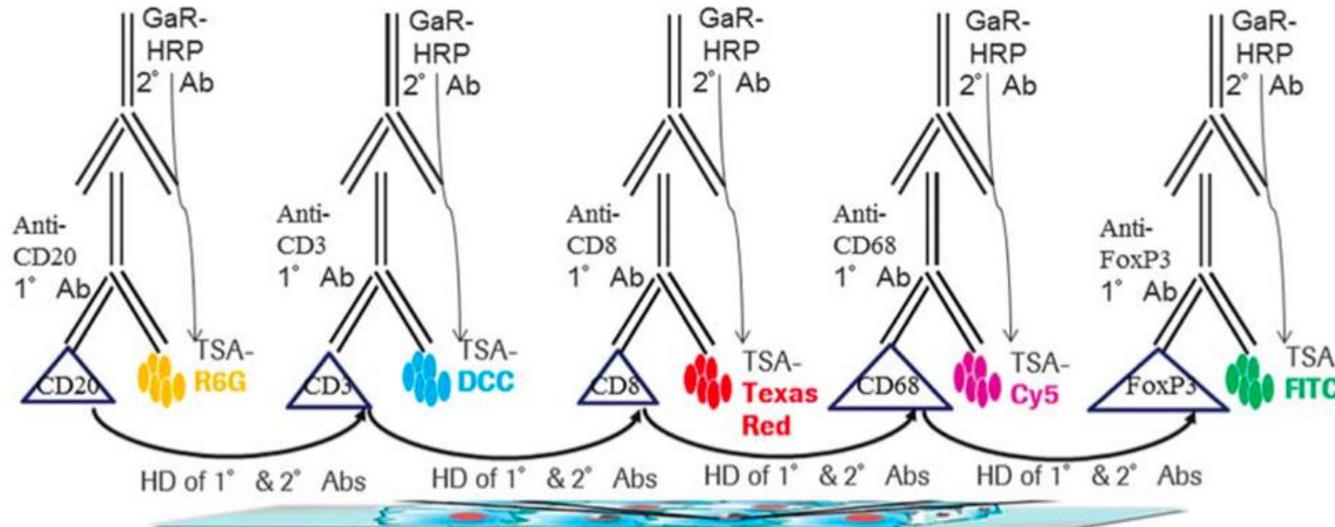

Figure 1 5-Plex IHC detection scheme.

Heat Deactivation (HD)/ Cross-talk controls important

Influence of HD on Fluorochromes/Epitopes

Detection order	TSA Fluor	Effect of HD on Fluor	1°Ab	Effect of HD on Epitope
1	R6G TSA	↓ Most Affected	CD20	Most Affected
2	DCC TSA		CD3	
3	Texas Red TSA		CD8	
4	Cy5 TSA		CD68	
5	FITC TSA		Least Affected	FoxP3

Optimizing a 3-plex method :

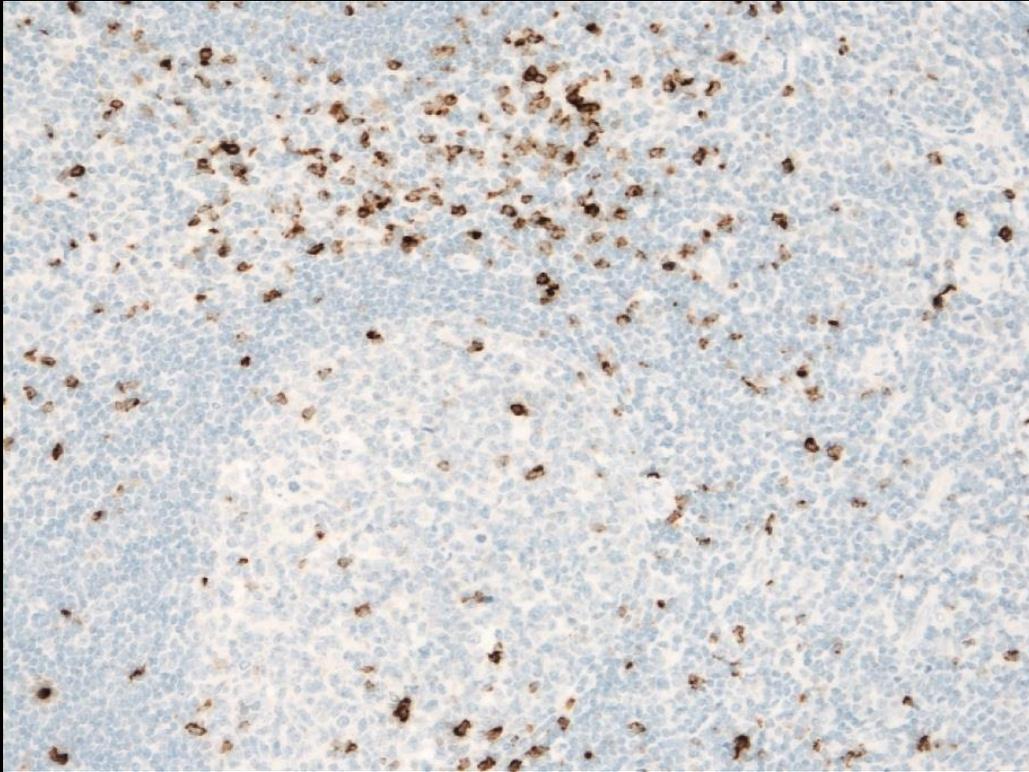

- SOX10, BS7 (Ms) or SOX10, SP267 (Rb) + LAG3, D2G40 (Rb) → first and second sequence, respectively
- CD8, C8/144B (or all other markers) → third sequence
 - Neutralization step is applied between sequences using different host`s of the primary Abs
 - Eliminates HRP activity of introduced immunoreagents
 - Heat Denaturation step is applied between sequences using same host of the primary Abs e.g., mAb`s in both first and second sequence
 - Eliminates cross reactivity between introduced immunoreagents.

Cross-talk Controls:

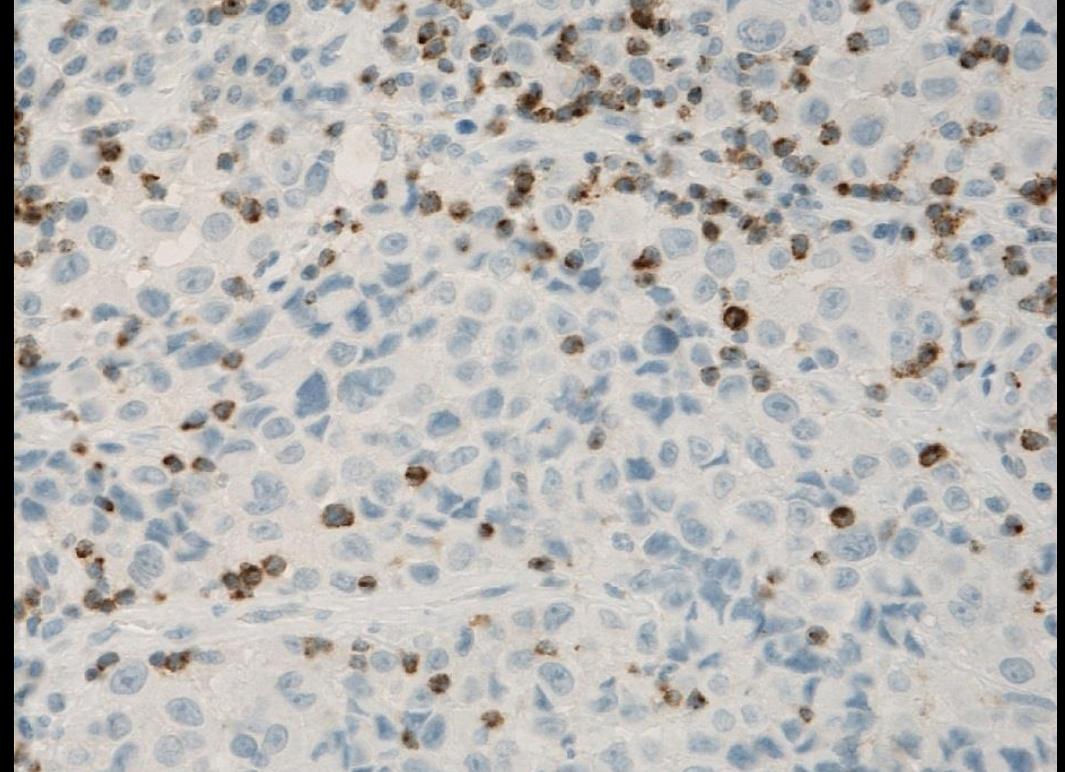

- Neutralization (N) control of HRP activity (should be completely eliminated)
 - Applied between sequences using different host`s of the primary Abs e.g., SOX10, BS7 (Ms) and LAG3, D2G40 (Rb) - detection systems do not cross-react (e.g., use Goat anti-Ms/HRP in the first and Goat anti-Rb/HRP in the second sequence).
- Heat Denaturation (HD) control of cross-reactivity between introduced immunoreagents (no reactions should be seen).
 - Applied between sequences using same host of the primary Abs e.g., mAb`s in both first and second sequence.

Optimizing a 3-plex method : Cross-talk controls

Cross-talk controls are important detecting unspecific staining reactions (e.g., cross-reactivity)

Antibody stripping is not always 100% efficient. It is important to empirically determine if previously bound antibodies are removed/denatured appropriately, as to ensure that the signals are not crosstalk

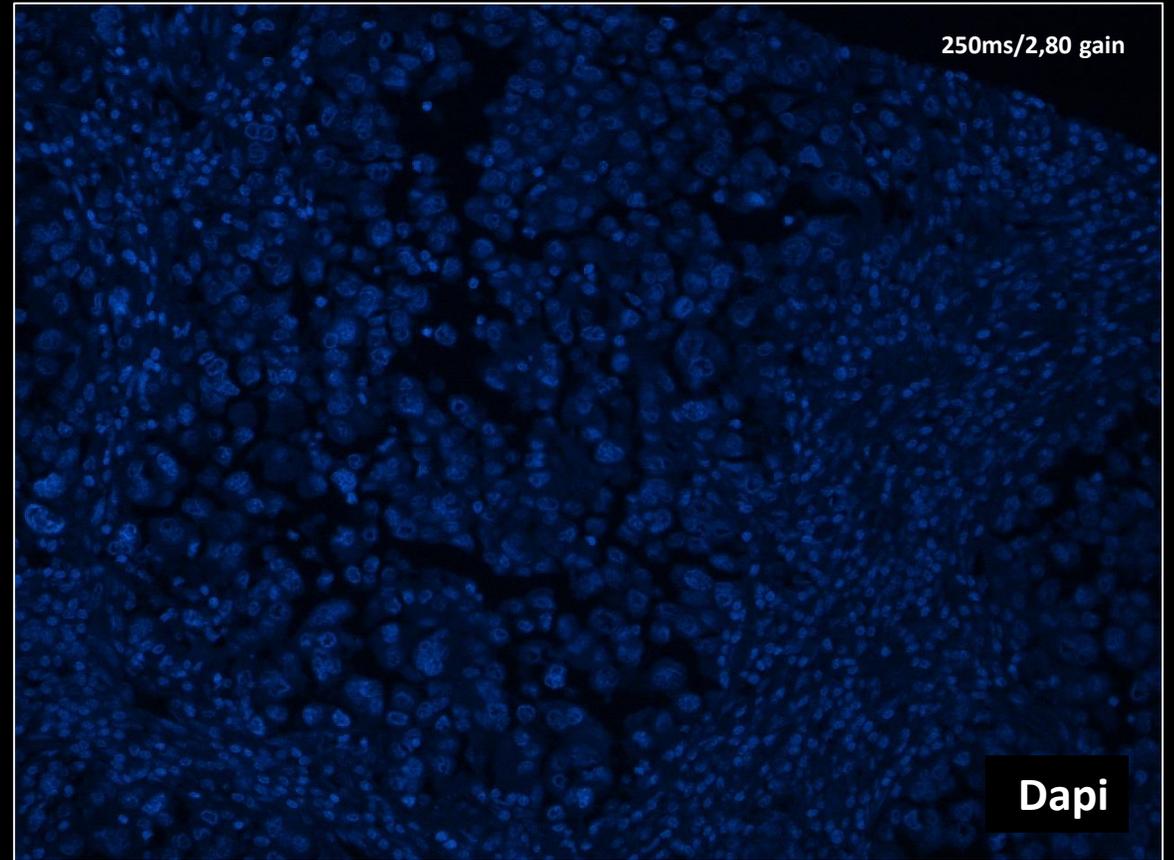

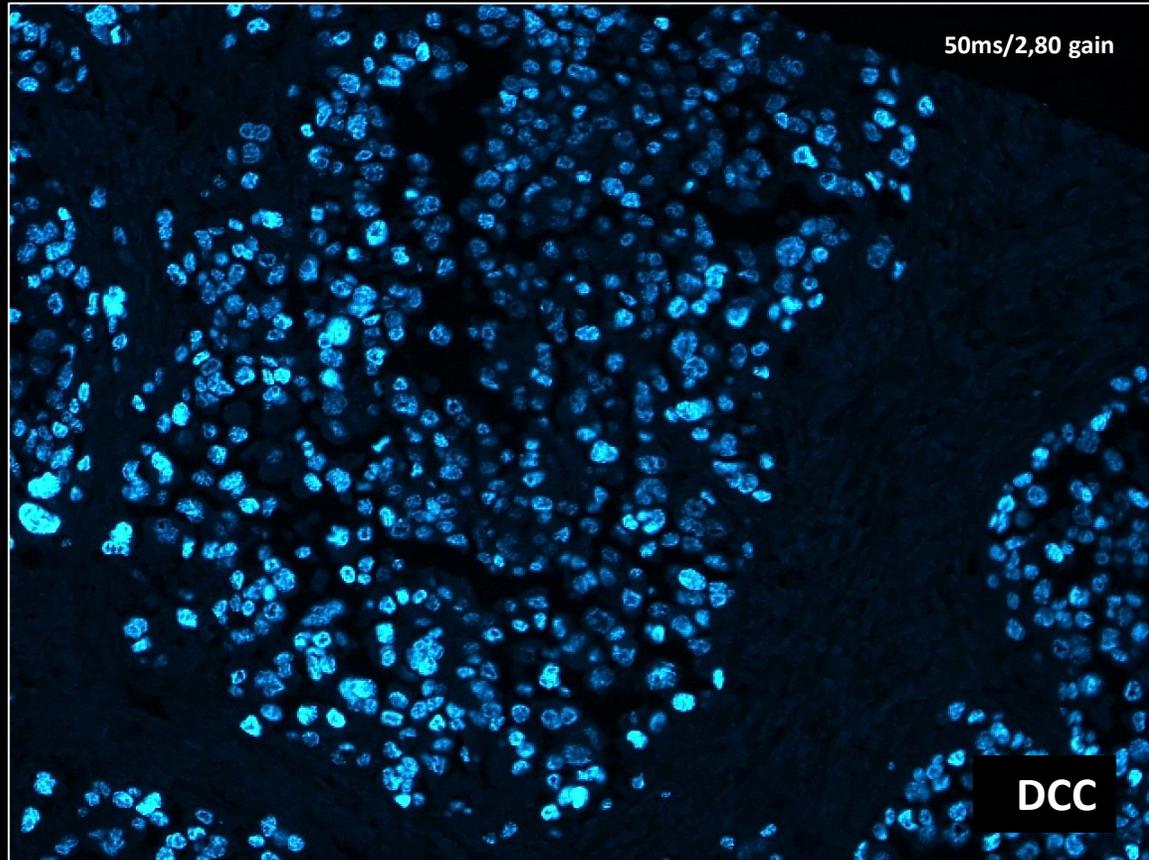

First sequence: SOX10, BS7 → OmniMap anti-Ms - HRP → TSA/DCC (Sp. Aqua) → N (incl. N control of HRP activity)

Second sequence: LAG3, D2G40 → OmniMap anti-Rb HRP → TSA/R610 (TxR) → HD (incl. HD controls for SOX10 and LAG3)

Third sequence: CD4, EP204 (or Mouse Ab) → OmniMap anti-Rb/HRP (or OmniMap anti-Ms/HRP) → TSA/FAM (FITC)

Cross-talk controls: Cross your fingers , otherwise you have a lot of work ahead

Melanoma

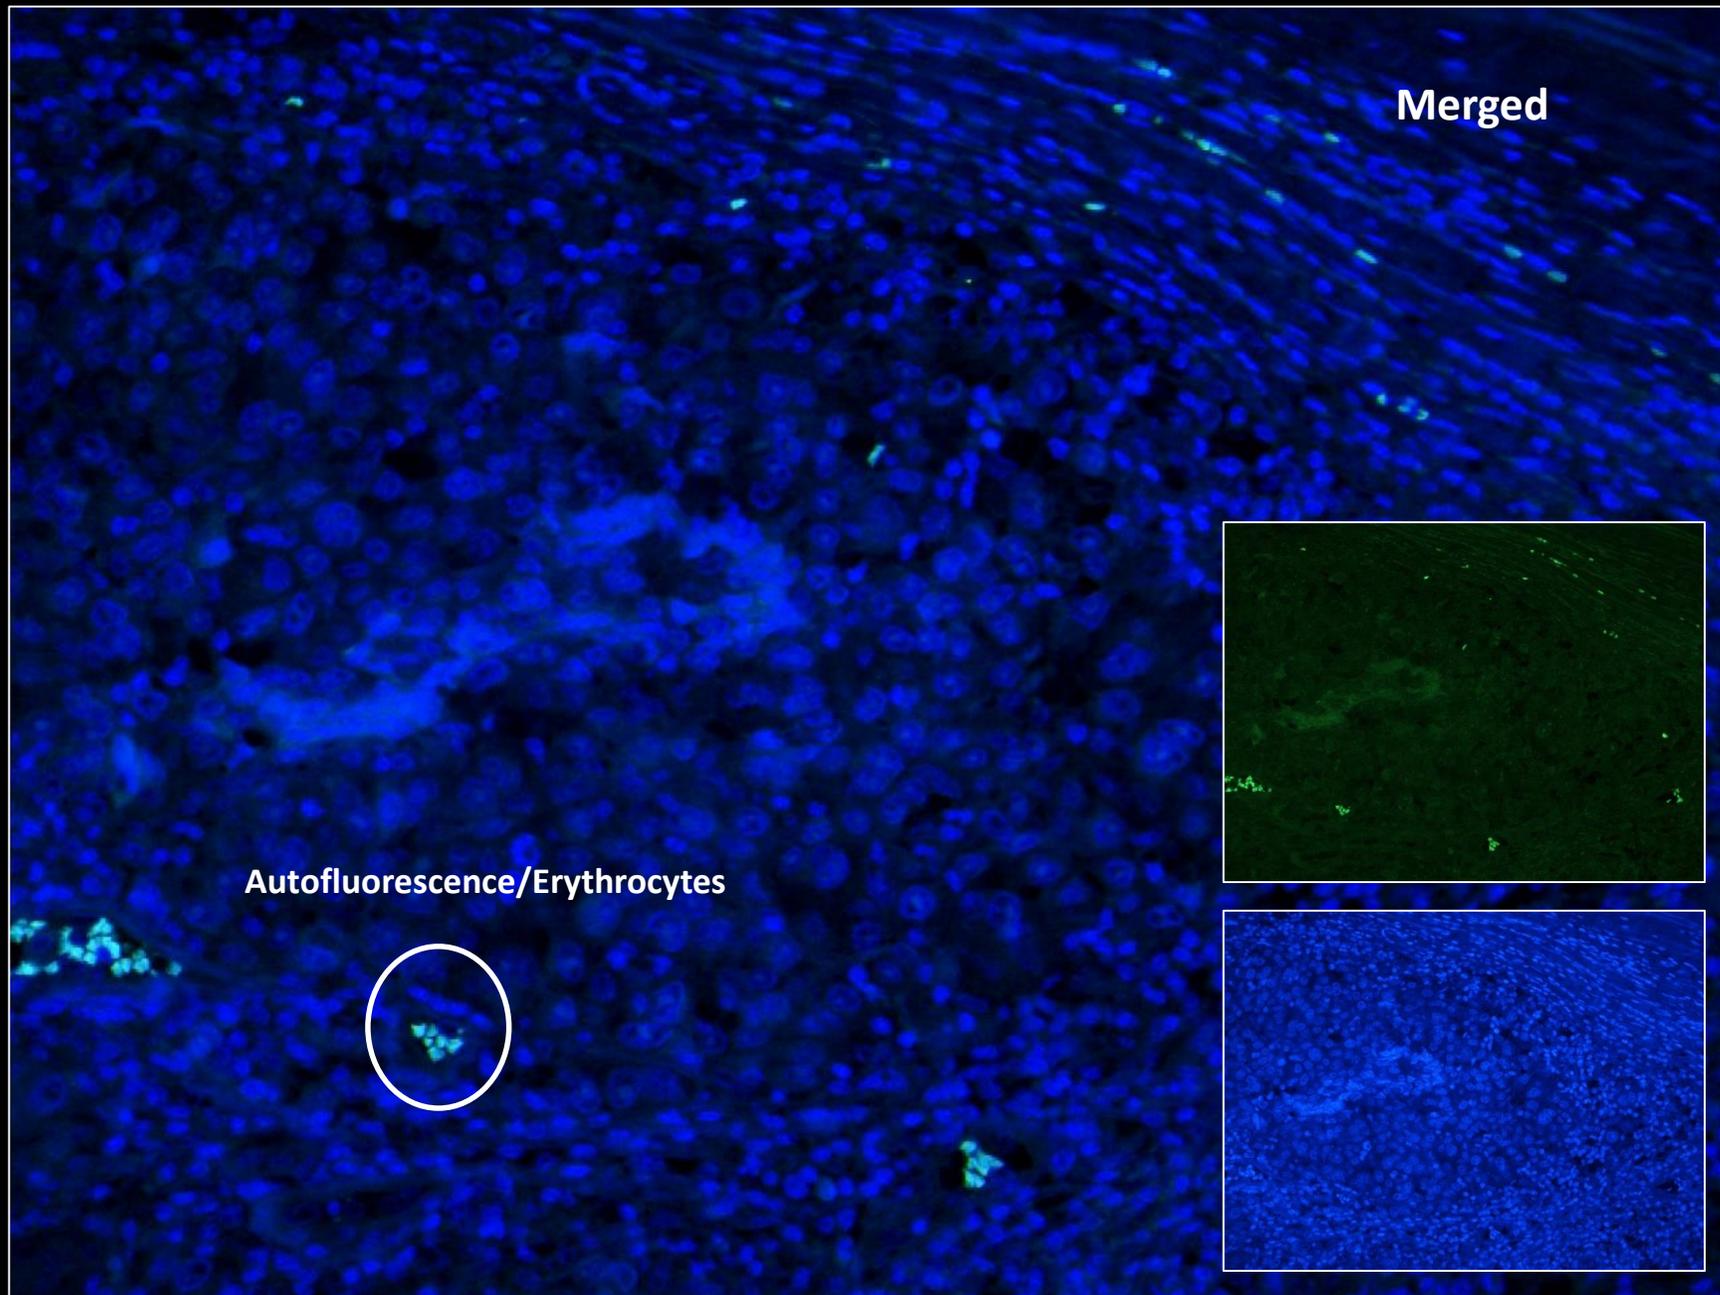

HIER: CC1 (48`/95°C)

SOX10, BS7/OmniMap Ms-HRP/ Neutralization/ TSA-FAM: "Eliminate HRP activity of the detection system"

Melanoma

HIER: CC1 (48`/95°C)

HD control (Drop out):

SOX10, BS7 (Ms)

OmniMap anti Ms/HRP

Omission of TSA-Fluorochrome

Heat Denaturation (HD)

Omission of second Ab (Diluent)

OmniMap anti Ms/HRP

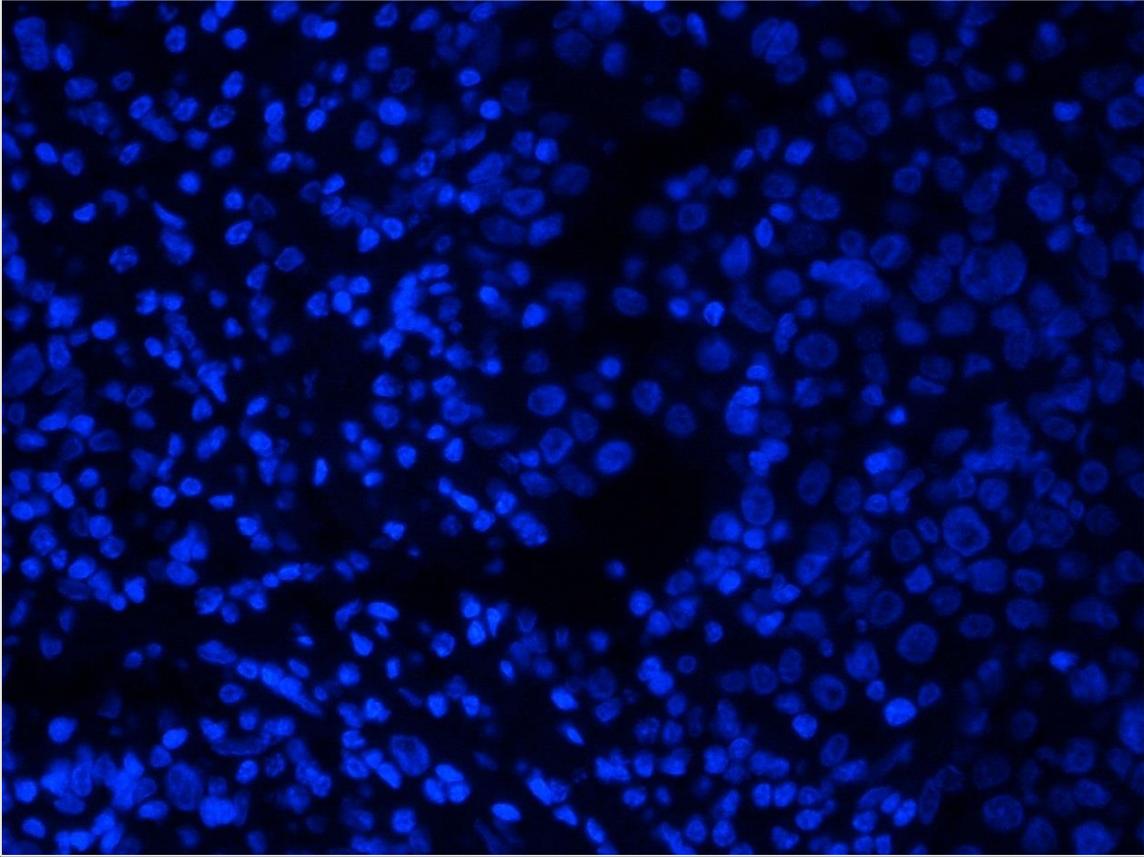

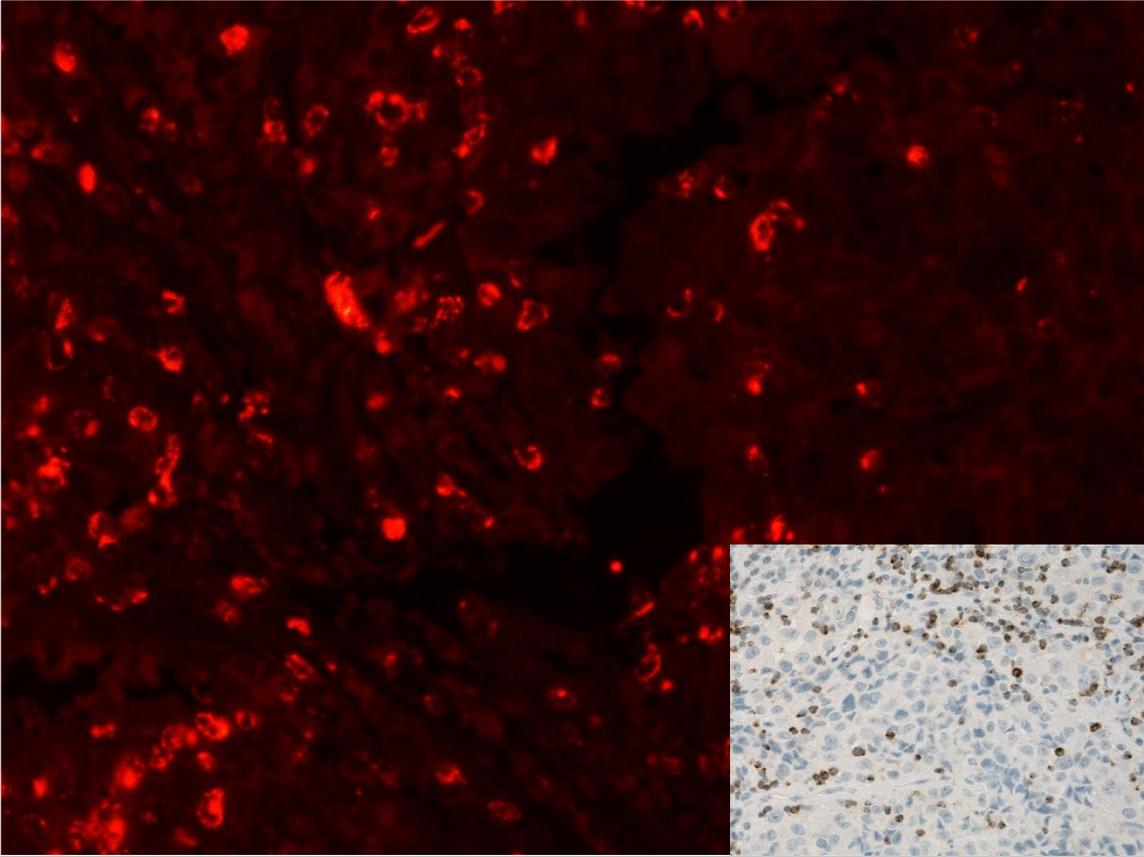

TSA-FAM

DAPI

Note: No nuclear staining reaction (FAM) of the neoplastic cells in the melanoma (cross-reactivity with SOX10)

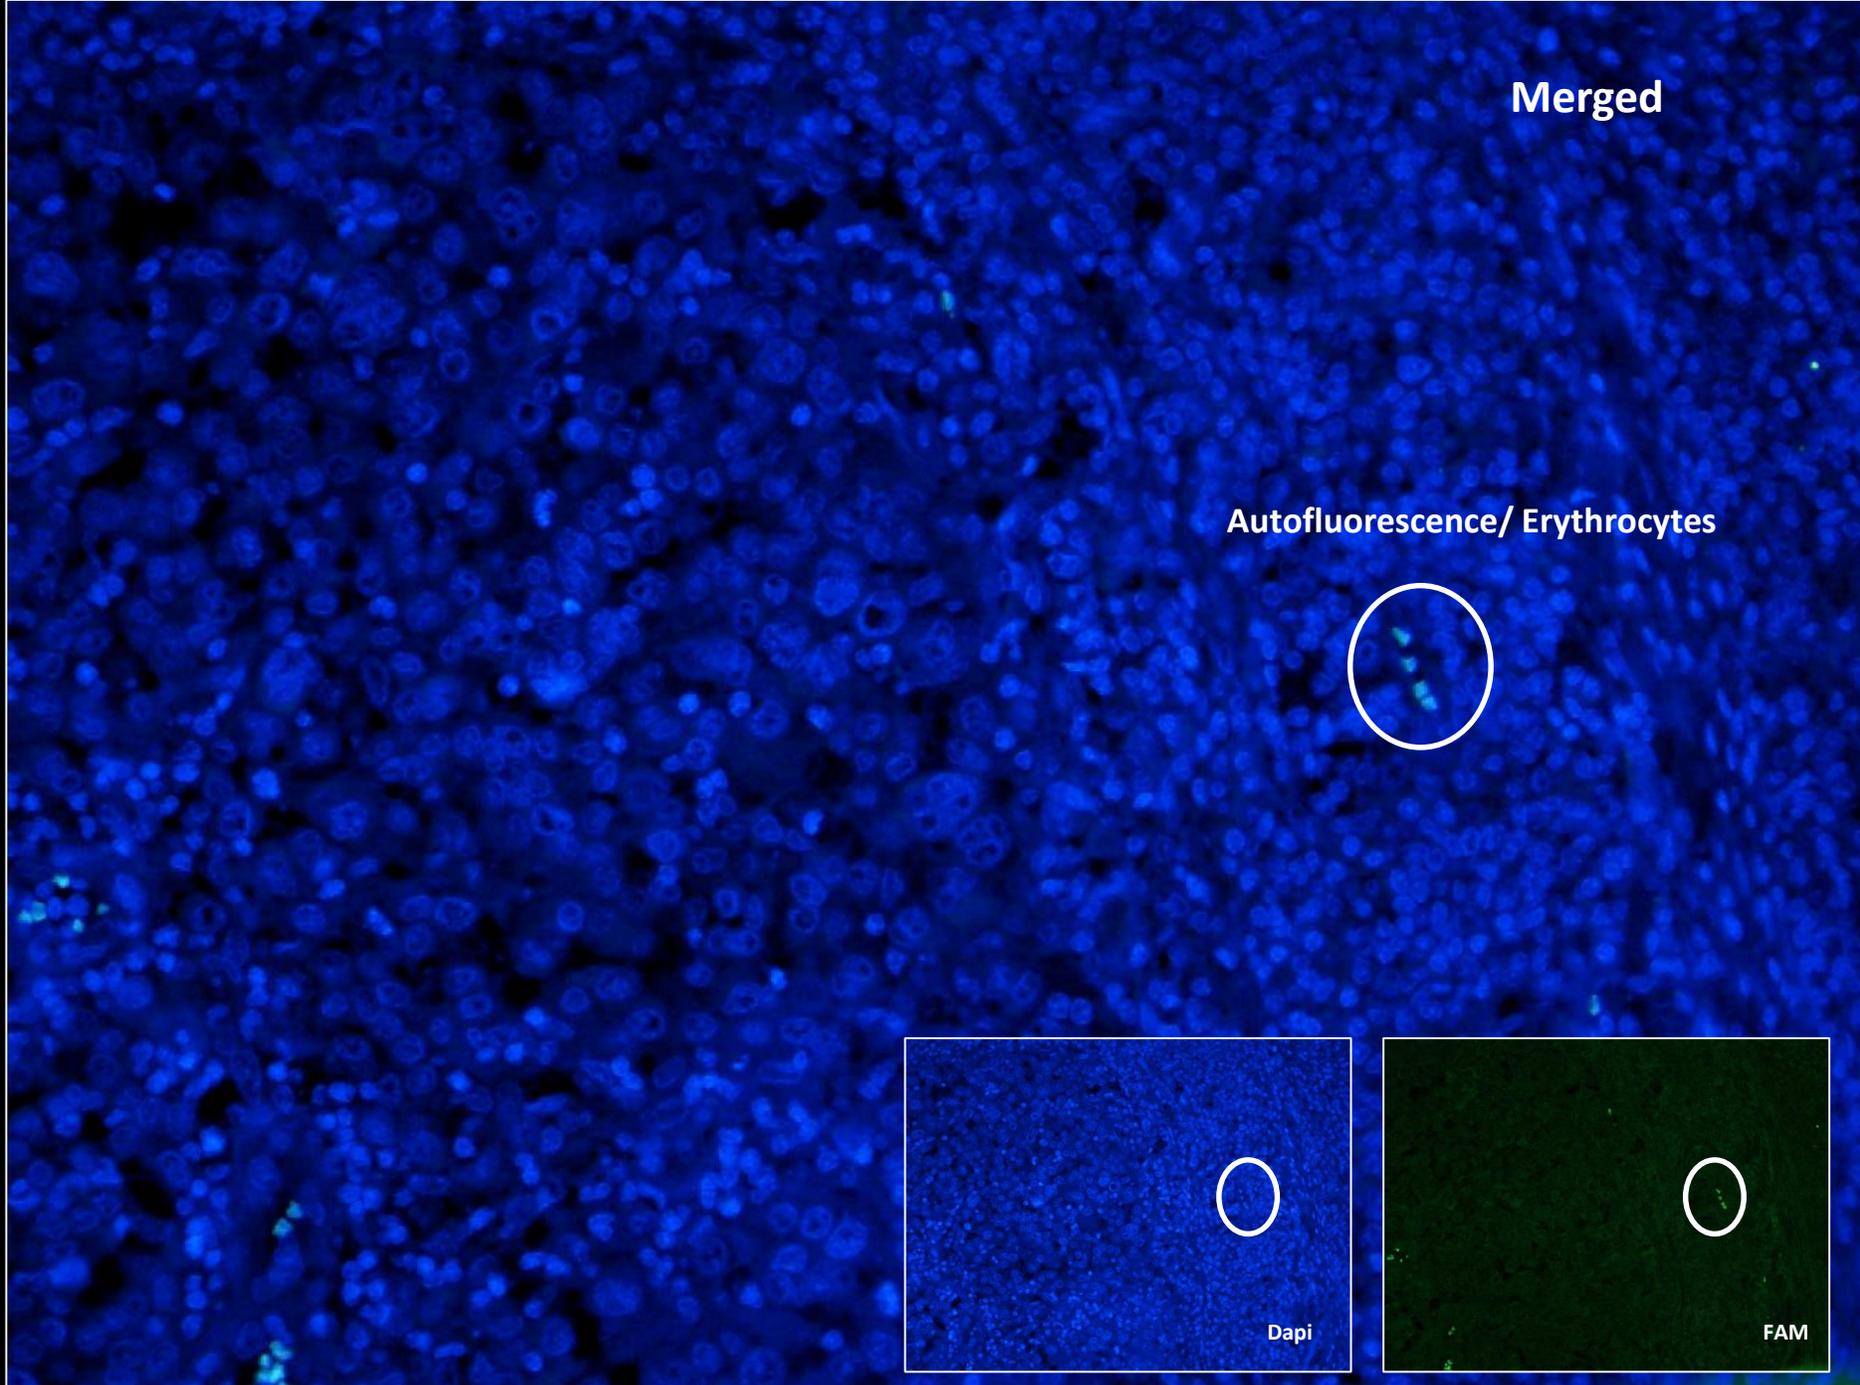

Successful HD step: Efficient elimination of SOX10, BS7 sequence

LAG3, D2G40/OmniMap Rb-HRP/Red 610

Melanoma

HIER: CC1 (48`/95°C)

Merged

Autofluorescence/ Erythrocytes

Dapi

FAM

HD control (Drop out):

LAG3, D2G40 (Rb)

OmniMap anti Rb/HRP

Omission of TSA-Fluorochrome

Heat Denaturation (HD)

Omission of second Ab (Diluent)

OmniMap anti Rb/HRP

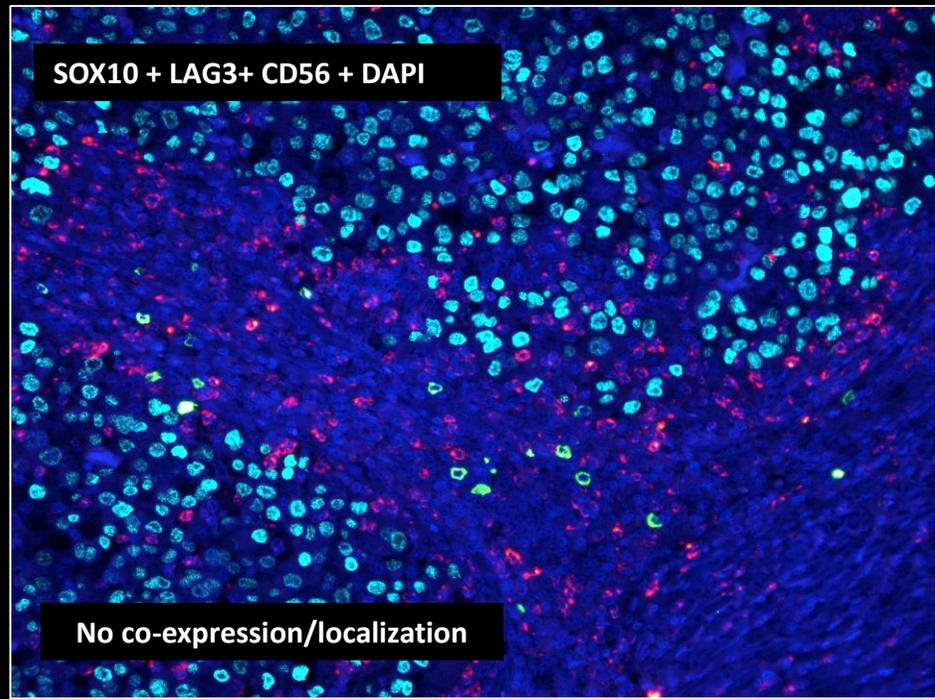

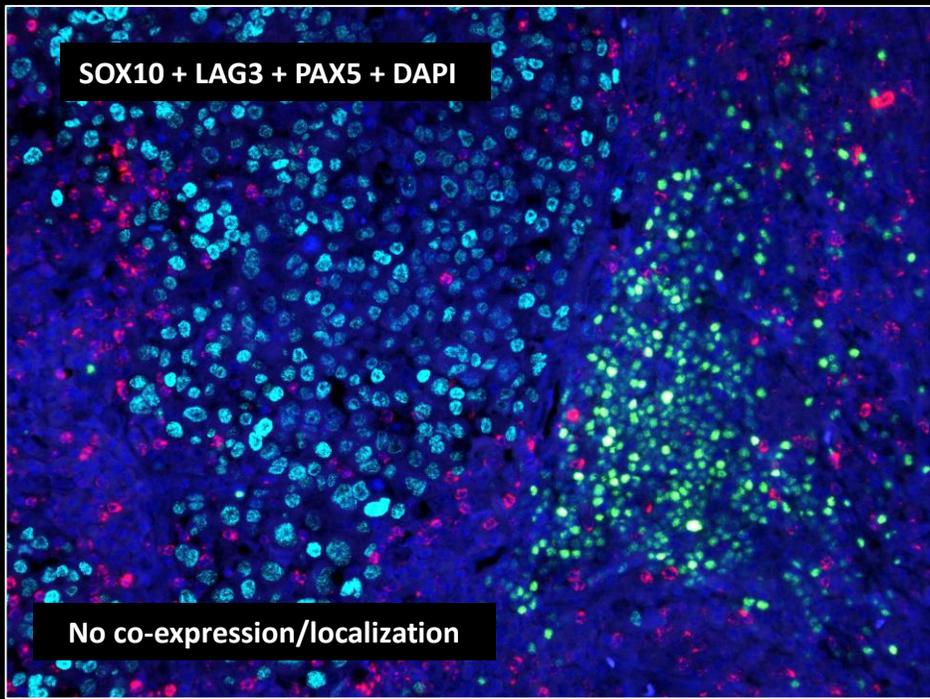

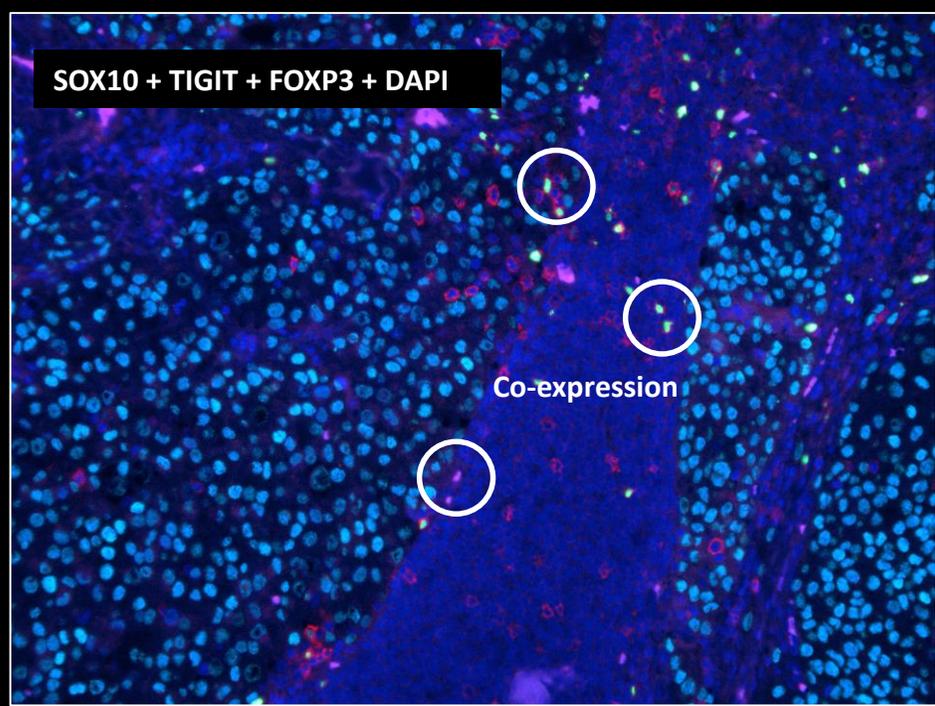

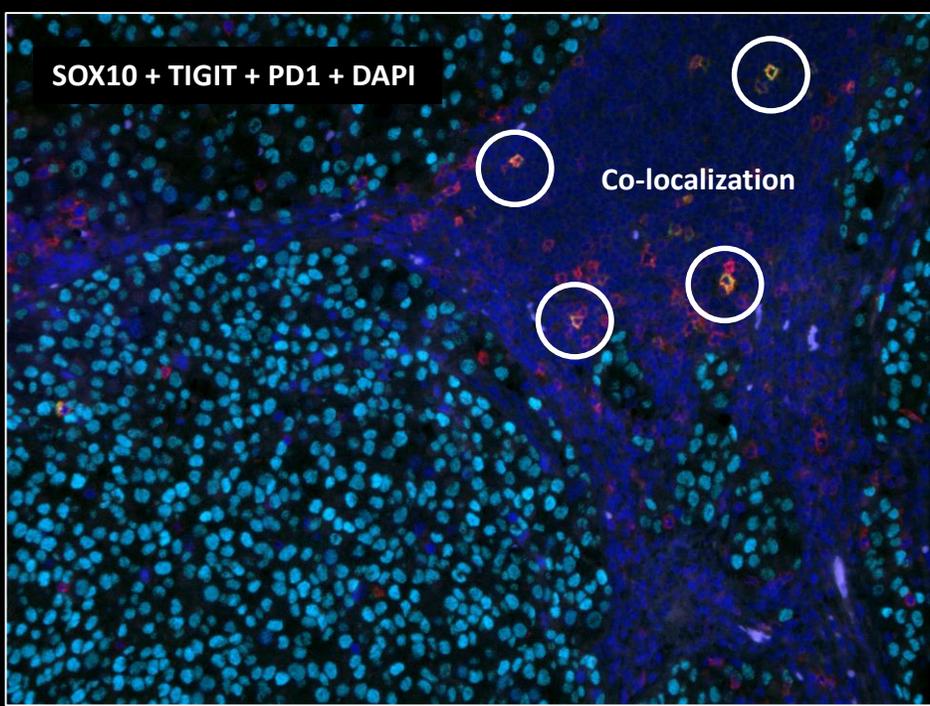

TSA-FAM

DAPI

Note: No cytoplasmic/membraneous staining reaction (FAM) of lymphocytes (cross-reactivity with LAG3)

Successful HD step: Efficient elimination of LAG3, D2G40 sequence

Thank you for your attention

Can we make the Simple technique even more simple ?

Do we have to use a sequential technique ?

Is it possible to avoid the blocking step (HIER in Ci) ?

Simultaneous Immunoperoxidase/phosphatase Labelling and Erasing Method

SIMPLE-Technique

SIMPLE-Technique (simultaneous procedure)

Dewax and Pretreatment (Antigen Retrieval)

Incubation with a mix of primary antibody reagents

Rabbit & Mouse monoclonal antibodies

Incubation with Dual-labelling Detection reagents

MultiVision (Mouse-HRP og Rabbit-AP) or MACH2 Double Staining 1 or 2

Incubation with HRP / Chromogen AEC Impact

Hematoxylin (one quick dip) / Mounting (hydrophilic) / Imaging / De-coverslip / Water or buffer

Erasing: Acetone followed by app. buffer

Incubation with AP / Chromogen Permanent Red / LBV-Blue /Warp Red

Mounting (hydrophilic PR or hydrophobic Warp Red / LBV-Blue) / Imaging

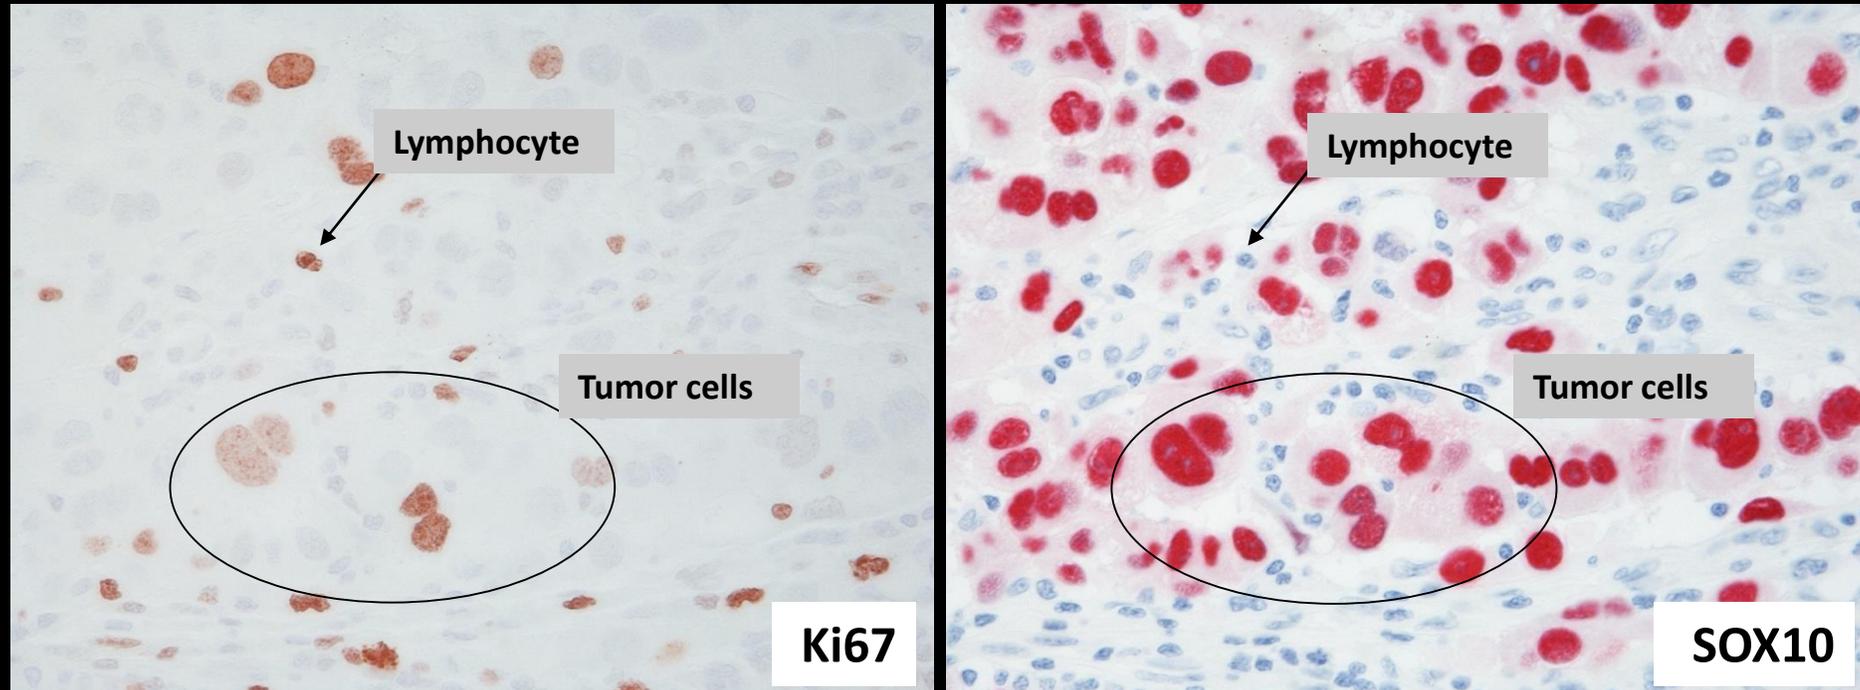

**Blocking procedure
not needed**

SIMPLE-Technique (simultaneous proc.): MACH2 Double Staining 1

rmAb Ki67, SP6 (1:25) + mAb Sox-10, BC34 (1:20)

AEC (Impact) - Erasing (Acetone) - Warp Red

Melanoma

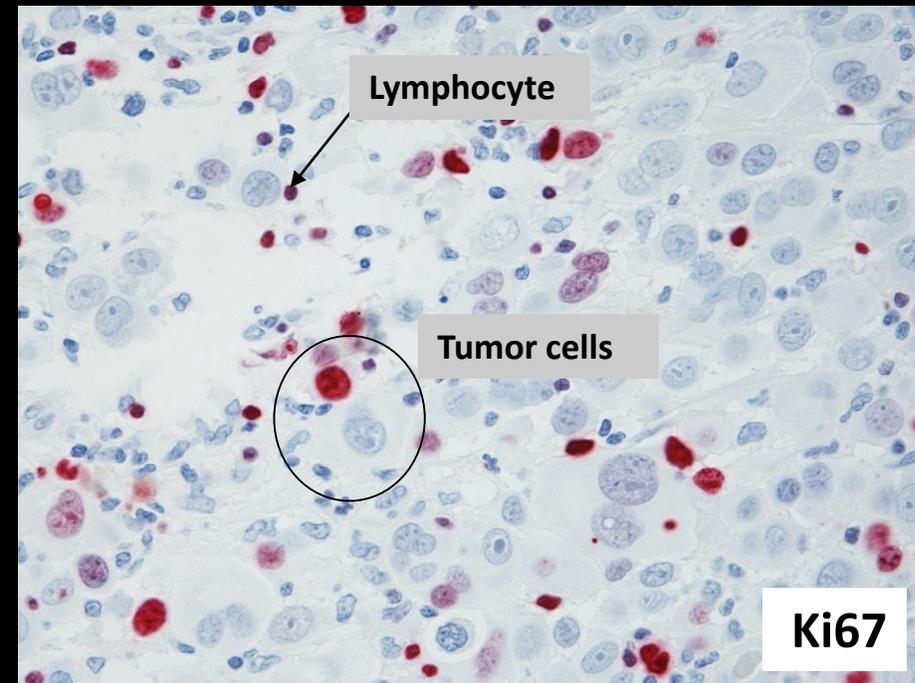

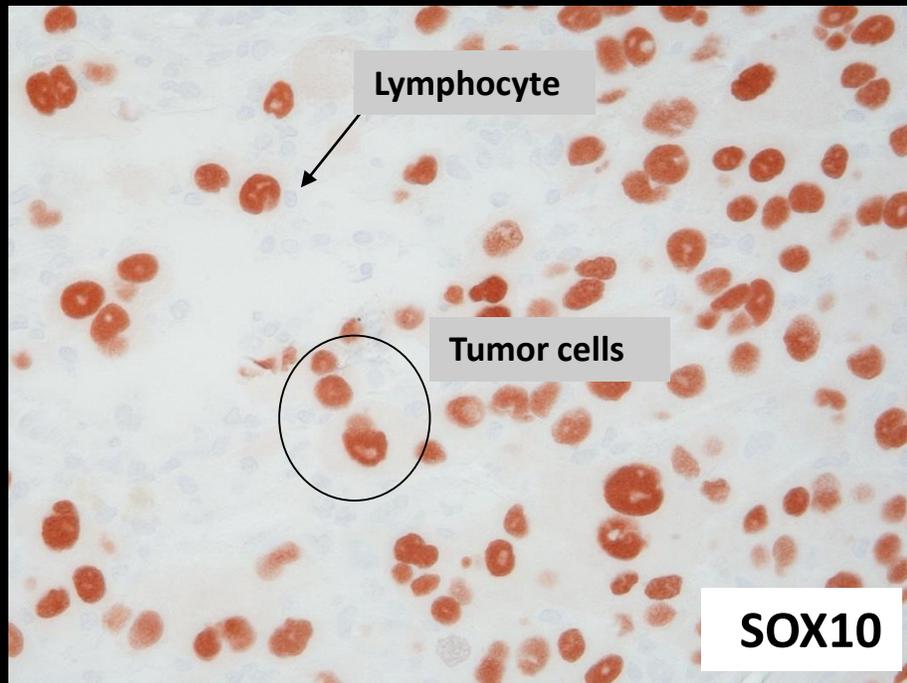

AEC (Impact) - (1dip Hematoxylin / coverslip-Aqueous/ Imaging / de-coverslip / Erasing-Acetone) - Warp Red

SIMPLE-Technique (simultaneous proc.): MACH2 Double Staining 2

mAb Sox-10, BC34 (1:20) + rmAb Ki67, SP6 (1:25)

AEC (Impact) - Erasing (Acetone) - Warp Red

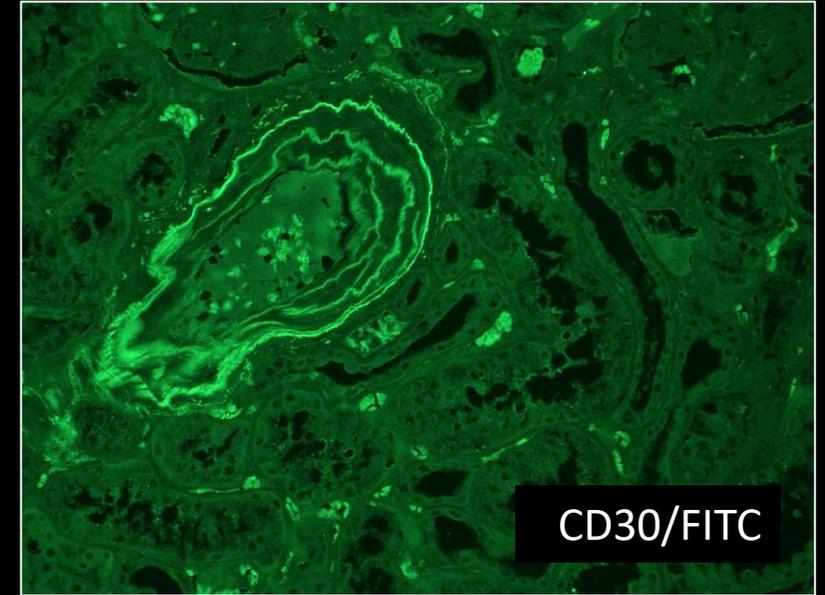

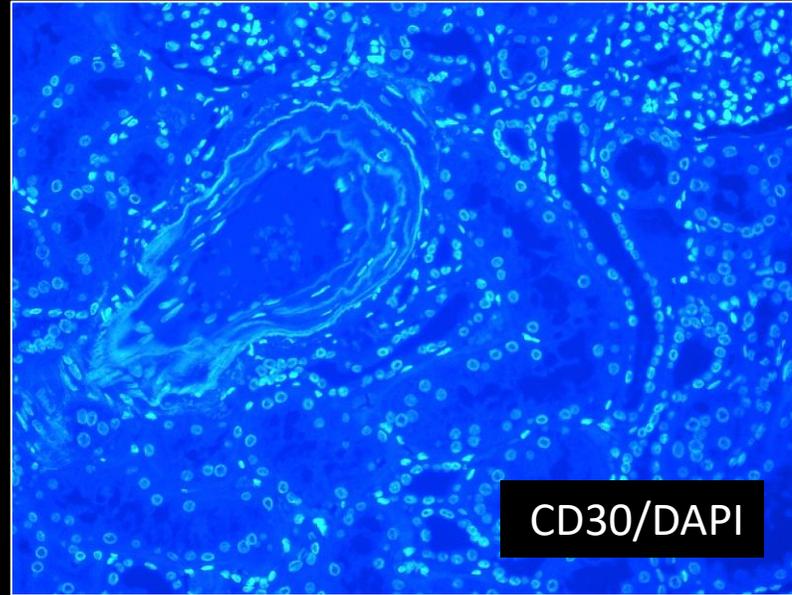

Melanoma

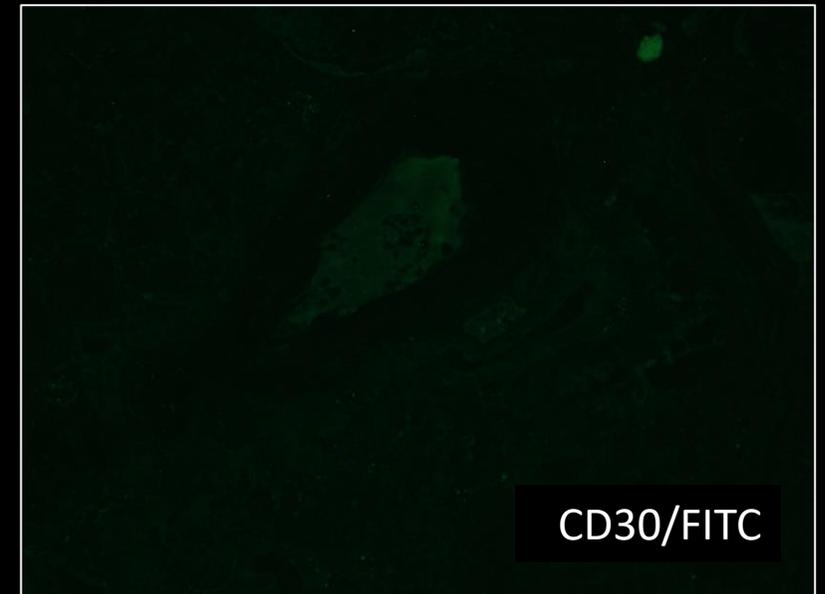

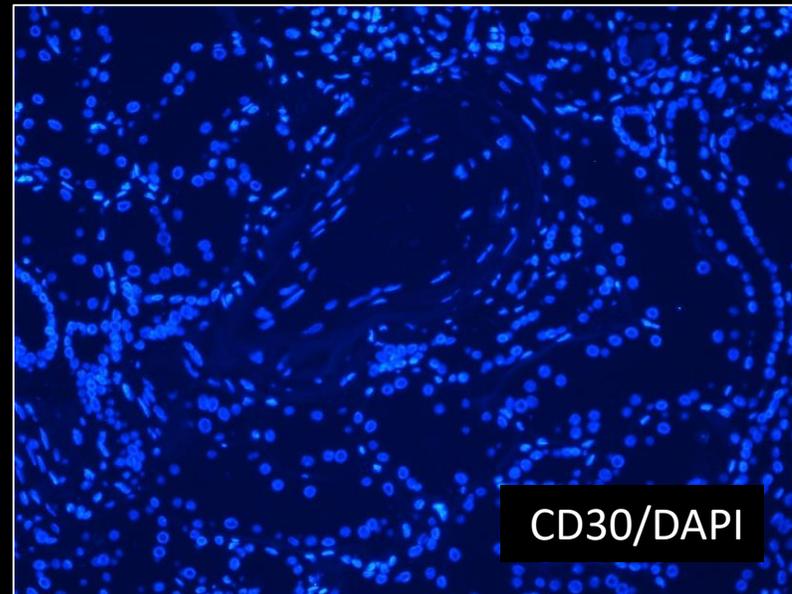

AEC (Impact) - (1dip Hematoxylin / coverslip-Aqueous/ Imaging / de-coverslip / Erasing-Acetone) - Warp Red

Quenching Autofluorescence

Without TrueView 5`

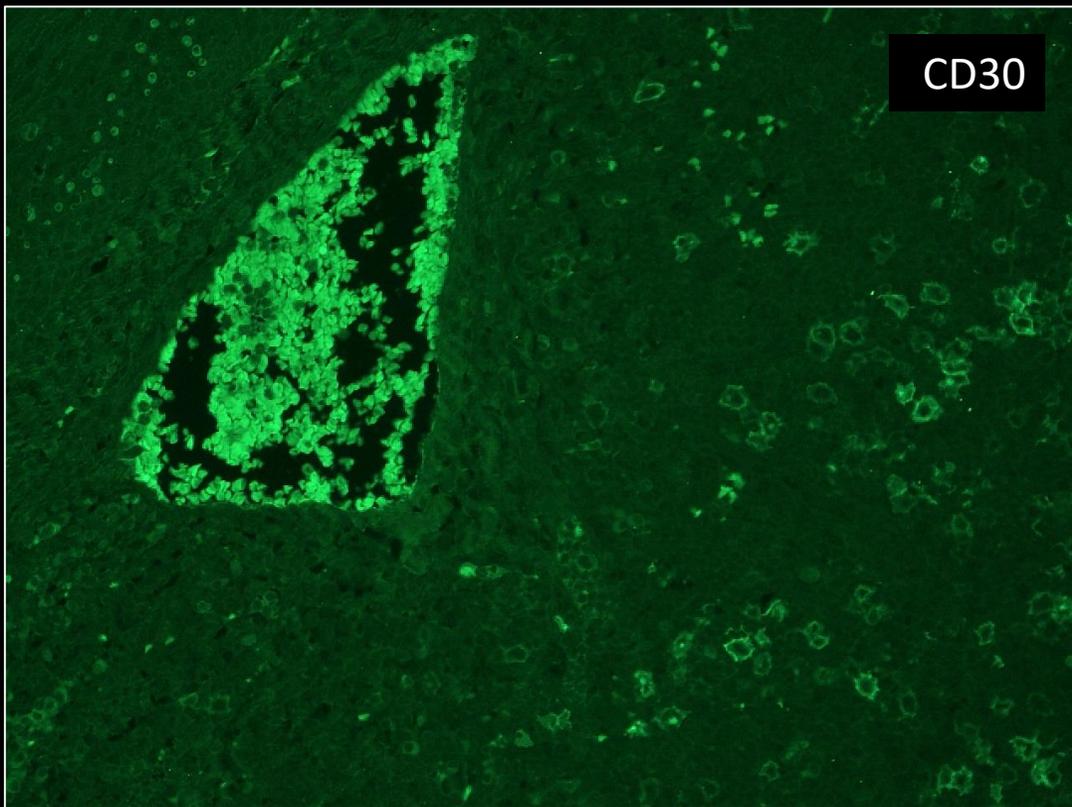

With TrueView 5`
(Vector Lab)

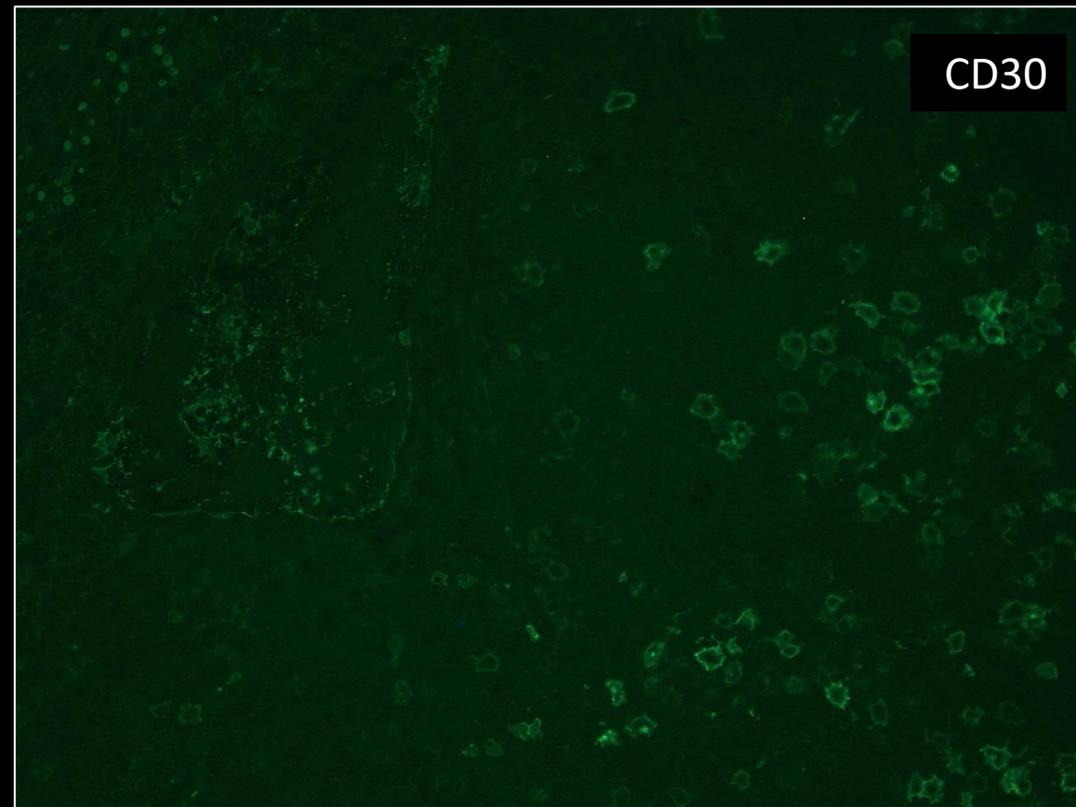

Kidney/ Microscope settings identical

Quenching Autofluorescence

Without TrueView 5`

With TrueView 5` (Vector Lab)

Quenching autofluorescence also seems to reduce the specific signal (time in TrueView needs to be adjusted)

Tonsil/ Microscope settings identical
