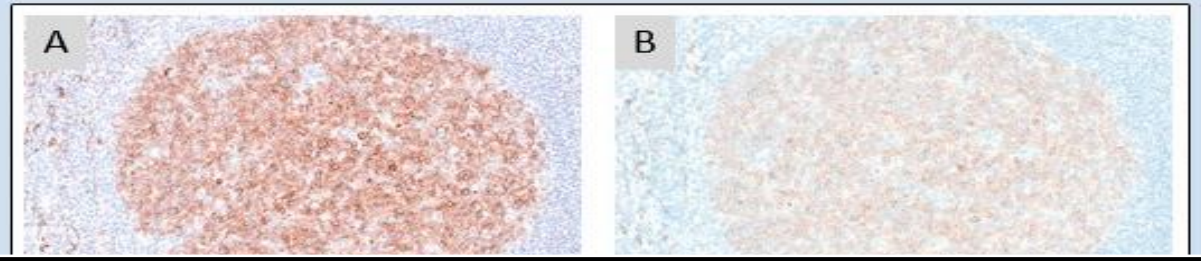
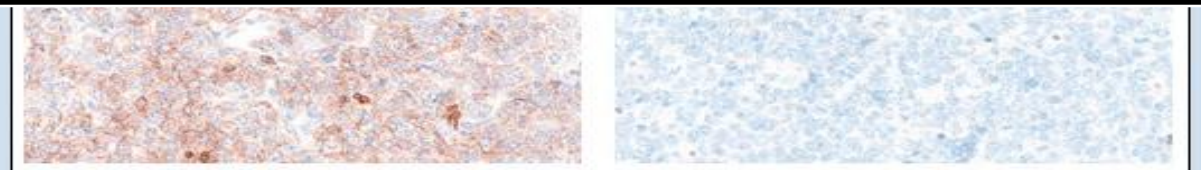
Results - Run 66, B34, H22, C12



External Quality Assurance programs

Staining quality varies significantly between different laboratories depending on the individual selection of methods and the technical expertise



IHC for CD10 in two laboratories:
Lab 1 (A+C): Optimal results in tonsil (A) and DLBCL (GCB subtype).
In the tonsil, even at low magnification, virtually all germinal centre B-cells show a moderate to strong distinct membranous staining reaction. In the DLBCL more than 30% of the neoplastic cells express CD10 as expected for the GCB subtype
Lab 2 (B+D): Insufficient result. In the tonsil, the intensity and proportion of positive germinal centre B-cells has decreased significantly and the neoplastic cells of the DLBCL being false negative.

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

The total test paradigm:
Key elements in the IHC procedure

The analytic phase :

Begins with dewax of the cut slides and is completed with the coverslipping of the stained slides.

Unlike the pre-analytic factors, analytic parameters can easily be modified and controlled within the immunohistological laboratory.

Pre-analytic phase

Pre-fixation
Fixation
Post-Fixation/Decalcification
Processing
Dehydration & clearing
Paraffin embedding
Sectioning
Drying/Storage

Analytic phase

Platform (manual/ Automated)
Epitope retrieval
Blocking
Primary Antibody
Detection system
Chromogen
Counterstain
Mounting

Post-analytic phase

Design of controls
Critical stain indicators
Internal/External control
Interpretation
Positive/Negative
Localization
Quantification
Cutt-of levels
Reporting

Technical aspects of IHC and pitfalls – Analytical phase

Optimization of the IHC assay – issues to be addressed

- Purpose and/or “fit-for-purpose” (assay validated for intended use)
- How to establish “best practice protocol” of the IHC test (Calibration of the IHC assay with focus clone, antigen retrieval, titer & detection system)
  - Is the IHC test reproducible/robust (pre-analytic conditions)
  - Evaluation of the analytical sensitivity and specificity
- Identification of most robust controls providing information that the established level of detection is obtained in each test performed in daily practice.

Tissue materials are essential for all these processes (calibration, validation and controls)

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Immunohistochemistry: Calibration of a biomarker/antibody depend on the type of marker and purpose of the test

IHC-type 1 markers (Diagnostic)

Often calibrated to produced appropriate level of sensitivity and specificity (positive versus negative)

IHC-type 2 markers (Disease screening, predictive treatment & prognosis)

Predictive markers: The assays are calibrated to provide information of which patients will or will not benefit from a specific treatment (HER-2, PD-L1 …….)

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Purpose and Intended use

4) RTU system developed for the Dako/Agilent semi-automatic system (Dako Autostainer), but used by laboratories on different platforms (e.g. Ventana BenchMark)
5) RTU system developed for the Leica Bond system, but used on the Ventana BenchMark system.

Purpose and Intended use

Material
The slide to be stained for MLA comprised:

1. Skin, 2. Kidney, 3. Adrenal gland, 4-5. Malignant melanoma, 6. Granulosa cell tumour.

All tissues were fixed in 10% neutral buffered formalin.

Melan A clone A103 (Run 56)

Melanoma/melanocyte assessment: 62% Sufficient/ 20% Optimal

Optimal results: Efficient HIER (alkaline buffer), high conc. of the primary Ab (app. 1:10-50) and a sensitive detection system (3-step)

Melanoma/melanocyte + steroid hormone assessment): Suff. 29%

Sufficient steroid hormone related A103 (cross)reaction can be very difficult to obtain on the Leica Bond, Ventana BenchMark and Dako Omnis platforms.

Melan A (MLA) / MART-1:

263 participants ~ 92% used clone A103 as single reagent (no cocktails)

asessed protocols).
4) Laboratory Modified Protocol Settings (LMPS) to a specific RTU product applied either on the vendor recommended platform(
validated semi/fully automatic systems or used manually (≥5 asessed protocols).

Purpose and Intended use

Material
The slide to be stained for MLA comprised:

1. Kidney, 2. Skin, 3-4. Malignant melanoma, 5. Colon Adenocarcinoma.

All tissues were fixed in 10% neutral buffered formalin.

Melan A/MART-1 (Run 60)

MLA, A103 (melanoma/melanocyte assessment): 87% Sufficient / 18% Optimal.

Optimal results: Efficient HIER (alkaline buffer), high conc. of the primary Ab (app. 1:10-50) and a sensitive detection system (3-step).

Performance of MLA clone A103 is sensitive to the chosen platform e.g., Omnis or Benchmark.

Melan A (MLA) / MART-1:
273 participants ~ 88% used clone A103 as single reagent (no cocktails)

Is MLA , A103 the best primary Ab for detection of melanomas ?

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

MLA Run 56, mmAb clone A103

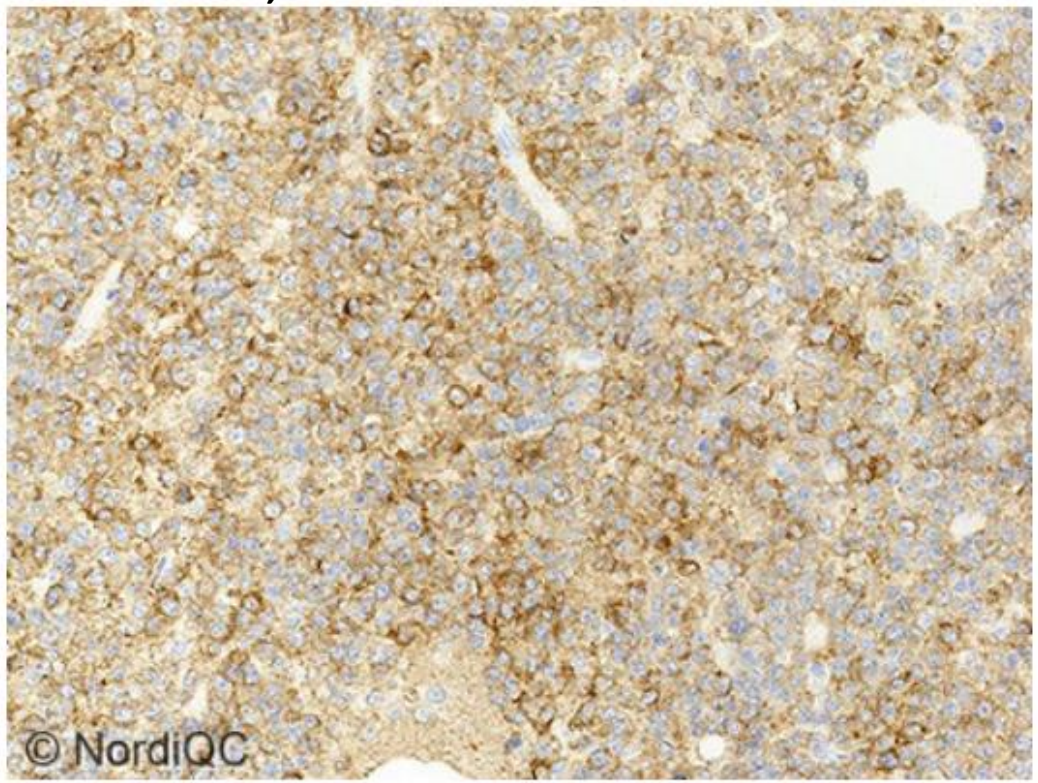

Fig. 8a
Optimal MLA staining of the malignant melanoma tissue core no. 4 (low-level expressor) using same protocol as in Figs. 7a and 7b. The majority of neoplastic cells show a weak to moderate cytoplasmic staining reaction. Compare with Figs. 7a and 8b, same protocol. Also compare with Figs. 5a and 5b - same field.

MLA Run 56, rmAb clone EP43

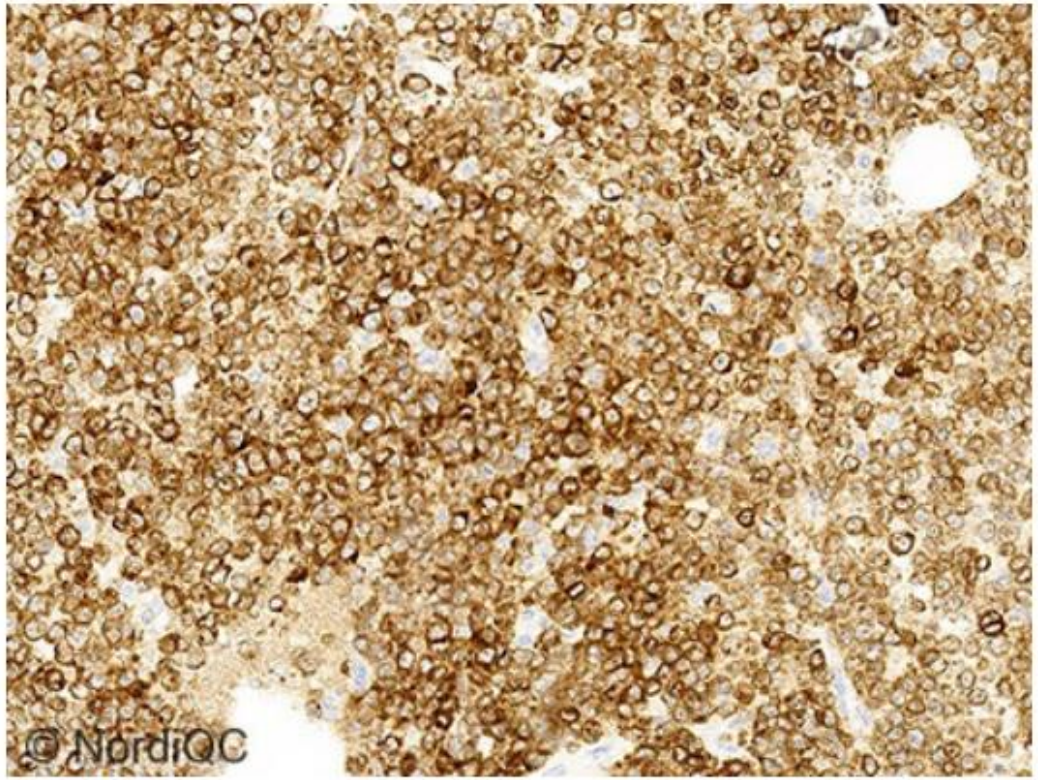

Fig. 8b
Optimal MLA staining of the malignant melanoma tissue core no. 4 (low-level expressor) using **rmAb EP43** in similar protocol settings as in Fig. 8a (and 7a and 7b) All neoplastic cells show a moderate to strong cytoplasmic staining reaction. In melanomas, rmAb EP43 produce very strong reactions. Compare with mAb A103 in Fig. 8a – same field.

Technical aspects of IHC and pitfalls – Analytical phase

Optimization of the IHC assay – issues to be addressed

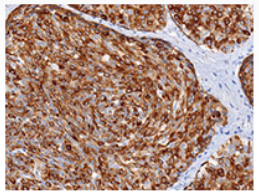
- Purpose and/or “fit-for-purpose” (assay validated for intended use)
- How to establish “best practice protocol” of the IHC test (Calibration of the IHC assay with focus clone, antigen retrieval, titer & detection system)
  - Is the IHC test reproducible/robust (pre-analytic conditions)
  - Evaluation of the analytical sensitivity and specificity
- Identification of most robust controls providing information that the established level of detection is obtained in each test performed in daily practice.

Tissue materials are essential for all these processes (calibration, validation and controls)

Calcitonin optimization (data sheets ?)

anti-Calcitonin (SP17), Rabbit Monoclonal Primary Antibody

Roche/ Ventana/ Cell Marque



Catalog Number:	760-4705
Ordering Code:	06586554001
Quantity:	50 tests
Controls:	Medullary Carcinoma of Thyroid
Isotypes:	IgG
Clone Name:	SP17
Species:	Rabbit
Localization:	Cytoplasmic
Regulatory Status:	IVD

This antibody is intended for in vitro diagnostic (IVD) use. Calcitonin (SP17) antibody is intended for qualified laboratories to qualitatively identify by light microscopy the presence of associated antigens in sections of formalin-fixed, para test methods. This antibody is used as an aid in the id diagnosis of thyroid medullary carcinoma within the c clinical history, and other diagnostic tests determined

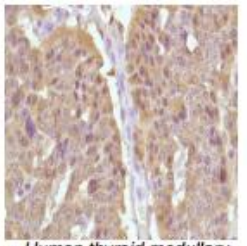
SPRING BIOSCIENCE

Rabbit Anti-Human Calcitonin Monoclonal Antibody (Clone SP17)

Spring Cat#	Roche P/N	Product Description
M3170	05492769001	0.1 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide.
M3172	06970419001	0.5 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide.
M3174	05298725001	1.0 ml rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.5 with less than 0.1% sodium azide.
M3171	05298717001	7.0 ml pre-diluted rabbit monoclonal antibody supplied as tissue culture supernatant in TBS/1% BSA buffer pH 7.6 with less than 0.1% sodium azide. (For manual IHC only)



Human thyroid medullary carcinoma stained with anti-calcitonin antibody

INTENDED USE: For Research Use Only. Not for use in diagnostic procedures.

CLONE: SP17

IMMUNOGEN: Synthetic human calcitonin 1-32 amino acid peptide.

IG ISOTYPE: Rabbbit IgG

EPITOPE: Not determined

MOLECULAR WEIGHT 15kDa

SPECIES REACTIVITY: Human (tested). (See www.springbio.com for information on species reactivity predicted by sequence homology.)

DESCRIPTION: Calcitonin is a 32 amino acid peptide which can be demonstrated in C cells of the normal and hyperplastic thyroid. Staining for calcitonin may be used for the identification of a spectrum of C cell proliferative abnormalities ranging from C cell hyperplasia to invasive tumors. Staining for calcitonin in medullary carcinoma of the thyroid produces a fine granular pattern in the cytoplasm. Amyloid deposits within the tumor may also exhibit varying degrees of calcitonin activity.

APPLICATIONS: Immunohistochemistry (IHC)

IHC PROCEDURE:
Specimen Preparation: Formalin-fixed, paraffin-embedded tissues are suitable for use with this primary antibody.
Deparaffinization: Deparaffinize slides using xylene or xylene alternative and graded alcohols.
Antibody Dilution: If using the concentrate format of this product, dilute the antibody 1:100 in Antibody Diluent (Cat# ADS-125). The dilutions are estimates; actual results may differ because of variability in methods and protocols.
Antigen Retrieval: None
Primary Antibody Incubation: Incubate for 30 minutes at room temperature.
Slide Washing: Slides must be washed in between steps. Rinse slides with PBS/0.05% Tween.
Detection: Detect the antibody as instructed by the instructions provided with the detection system.

POSITIVE CONTROL: Thyroid medullary carcinoma

CELLULAR LOCALIZATION: Cytoplasm

Can we use the recommendations provided by the manufactures spec sheets?

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Optimizing IHC test (IHC-type 1) - parameters to consider

Use a “Test Battery Approach” (TBA) (involves different pre-treatment regimes and dilution ranges)

Test more than one antibody clone against an antigen of interest before implementation in the routine

Test with robust, specific & sensitive detection system

Test/validate on normal and tumor tissue material with broad spectrum of antigen densities (specificity/sensitivity)

Compare results with external quality assurance programs, literature or colleagues

No antibody should be acquired without the basic knowledge of its performance characteristics and expected expression pattern

Recommendations for Improved Standardization of Immunohistochemistry

Neal S. Goldstein, MD, Stephen M. Hewitt, MD, PhD, Clive R. Taylor, MD, DPhil, Hadi Yaziji, MD, David G. Hicks, MD, and Members of Ad-Hoc Committee On Immunohistochemistry Standardization

Abstract: Immunohistochemistry (IHC) continues to suffer from variable consistency, poor reproducibility, quality assurance disparities, and the lack of standardization resulting in poor concordance, validation, and verification. This document lists the recommendations made by the Ad-Hoc Committee on Immunohistochemistry Standardization to address these deficiencies. Contributing factors were established to be underfixation and irregular fixation, use of nonformalin fixatives and ancillary fixation procedures divested from a deep and full understanding of the IHC assay parameters, minimal or absent IHC assay optimization and validation procedures, and lack of a standard system of interpretation and reporting. Definitions and detailed guidelines pertaining to these areas are provided.

Key Words: immunohistochemistry, pathology, assay, oncology, standardization, procedure, tissue, fixation

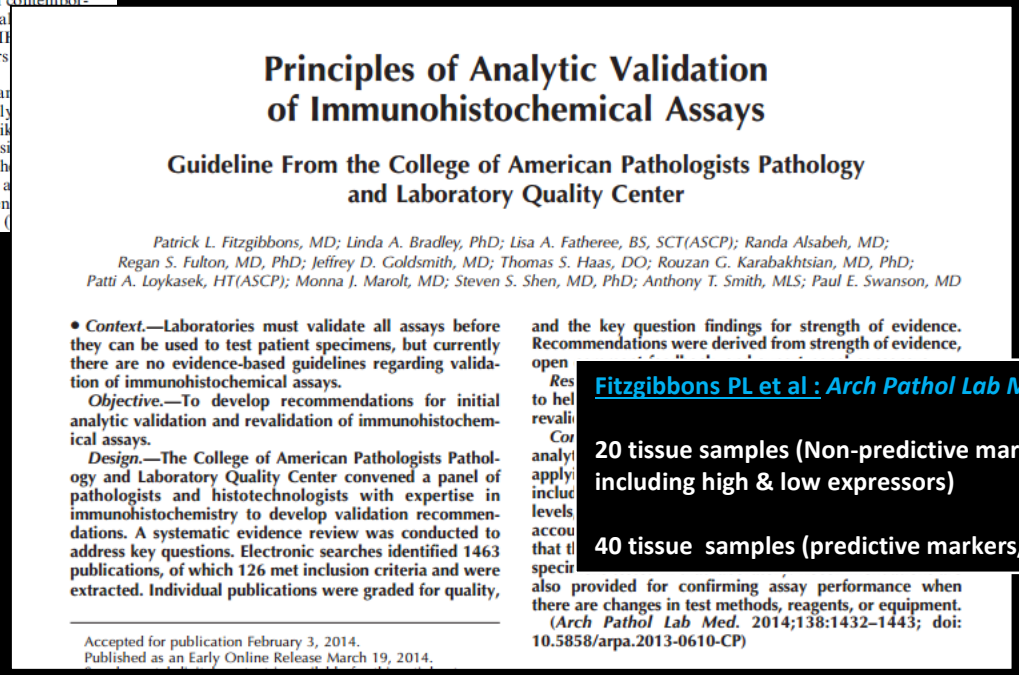
(*Appl Immunohistochem Mol Morphol* 2007;15:124–133)

IHC assay standardization was vital for reproducible and reliable results. Agencies, including the Biologic Stain Commission, CLSI (previously NACCLS), FDA, and the manufacturing sector established guidelines, standards, and recommendations for reagents and package inserts. These efforts have resulted in consistent, high-quality assay components and instruments on which contemporary IHC is performed.[1–4] It has also a development and use of so-called black box I in which IHC assays have preset parameters manufacturer.[5]

Despite the improvements of reagents a tion, authors over the years have consistently inconsistent quality of IHC assays.[6–11] Unlik IHC-epochs, most of the causative responsi with the individual laboratory performing th specifically, the lack of standardization and a quality assurance programs.[12,13] Prior consen ences identified the likely causative factors (

[Goldstein NS et al :](#) *Appl Immunohistochem Mol Morphol 2007 Mar; 15 : 124-133*

25 tissue samples (Non-predictive markers/ IHC-type I: 10 high, 10 low and 5 non-expressors)



Principles of Analytic Validation of Immunohistochemical Assays

Guideline From the College of American Pathologists Pathology and Laboratory Quality Center

Patrick L. Fitzgibbons, MD; Linda A. Bradley, PhD; Lisa A. Fatheree, BS, SCT(ASCP); Randa Alsabeh, MD; Regan S. Fulton, MD, PhD; Jeffrey D. Goldsmith, MD; Thomas S. Haas, DO; Rouzan G. Karabakhtsian, MD, PhD; Patti A. Loykasek, HT(ASCP); Monna J. Marolt, MD; Steven S. Shen, MD, PhD; Anthony T. Smith, MLS; Paul E. Swanson, MD

• *Context.*—Laboratories must validate all assays before they can be used to test patient specimens, but currently there are no evidence-based guidelines regarding validation of immunohistochemical assays.

Objective.—To develop recommendations for initial analytic validation and revalidation of immunohistochemical assays.

Design.—The College of American Pathologists Pathology and Laboratory Quality Center convened a panel of pathologists and histotechnologists with expertise in immunohistochemistry to develop validation recommendations. A systematic evidence review was conducted to address key questions. Electronic searches identified 1463 publications, of which 126 met inclusion criteria and were extracted. Individual publications were graded for quality, and the key question findings for strength of evidence. Recommendations were derived from strength of evidence, open

Abstract: The numbers of diagnostic, prognostic, and predictive immunohistochemistry (IHC) tests are increasing; the implementation and validation of new IHC tests, revalidation of

Key Words: immunohistochemistry, quality tools, tissue tools, test development, quality assurance, biomarker, validation

(*Appl Immunohistochem Mol Morphol* 2017;25:227–230)

Article sequence (part 1-4) published in Appl Immunohistochem Mod Morphol (2017) systematically describing/defining all aspects of the IHC test from purpose (fit-for-purpose) of a test, through test performance characteristics (analytical sensitivity, analytical specificity, preanalytical reproducibility……), importance of validation with focus on the technical part and the use of tissue tools for Quality assurance in immunohistochemistry.

Tissue and validation :

Specificity TMA

- 10-20 benign normal tissue types

Index TMA

- At least 3 to 10 cases to show a broad range of biologically relevant expression levels should be selected (eg, negative, weak, strong)

Accuracy TMA

- 20 carefully selected cases/IHC-type 1 test
- 40 carefully selected cases/IHC-type 2 test

Pre-analytic TMA

- Pre-analytic conditions relevant for clinical practice (e.g. fix. time)
- With focus on high, low and non-expressor (“iCAPS”)

Full technical validation

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

Main causes of insufficient staining reactions are related to:

- The choice of antigen retrieval method
- The choice of primary antibody (Concentrate or RTU)
  a) Calibration of the antibodies (dilutions)
  b) Stainer platform dependent antibodies
- The choice of detection system

83 % of insufficient results

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

89 markers assessed during the period 2003-2015 and several markers have been assessed several times. Seven runs for HER2 ISH (more than 30000 slides assessed)

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

Problems related to the choice of antigen retrieval methods:

- Use of non-alkaline HIER buffer (low pH buffer)
- Use of inefficient / too short HIER period
- Use of no / enzymatic pre-treatment instead of HIER
- Use of excessive retrieval procedure → impaired morphology

False positive or false negative results

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

27% insuff.

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

The purpose of antigen retrieval is to unmask antigenic determinants (epitopes) and recover immuno-reactivity

Antigen retrieval procedures for formalin fixed tissue:

- ❑ **Heat Induced Epitope Retrieval (HIER)**
- ❑ **Tissue digestion using proteolytic enzymes**
- ❑ **Combined pre-treatment (HIER with proteolytic digestion)**

Antigen Retrieval in Formalin-fixed, Paraffin-embedded Tissues: An Enhancement Method for Immunohistochemical Staining Based on Microwave Oven Heating of Tissue Sections

SHAN-RONG SHI, MARC E. KEY,[1] and KRISHAN L. KALRA
BioGenex Labora

Received for publ

We describe a n
formalin-fixed,

HIER

Shi et al. demonstrated that :

- **Enzyme pre-digestion of tissue could be omitted.**
- **Incubation time with primary antibodies could be reduced, or dilutions of primary antibodies could be increased.**
- **Staining could be achieved on long-term formalin fixed tissue that failed to stain with conventional methods.**
- **Certain antibodies which where typically unreactive with formalin-fixed tissue gave excellent staining.**

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

The mechanism of HIER is not completely understood, but several hypothesizes has been proposed:

Heating tissue sections in an appropriate buffer may unmask epitopes by :

- ❑ Hydrolysis/disruption of methylene cross-links formed by formalin fixation
- ❑ Extraction of diffusible blocking proteins
- ❑ Precipitation/denaturation of proteins
- ❑ Rehydration of the tissue section allowing better penetration of the antibody
- ❑ Removal of tissue-bound calcium ions by chelating substances
- ❑ Other mechanism´s ?

ORIGINAL PAPER

Hypothesis for the mechanism for heat-induced antigen retrieval occurring on fresh frozen sections without formalin-fixation in immunohistochemistry

Kochi Kakimoto · Susumu Takekoshi · Katsuhiro Miyajima · R. Yoshiyuki Osamura

Demonstrated that: unfixed frozen sections, which did not show immunostaining with nine antibodies, were clearly stained after heating the sections

These results indicate that other mechanisms than breaking formalin-induced cross-linkages may be present.

The authors proposed that : the accessibility to some target epitopes of antigenic proteins is limited by natural steric barriers even in the fresh state (frozen sections) caused by the antigenic protein itself

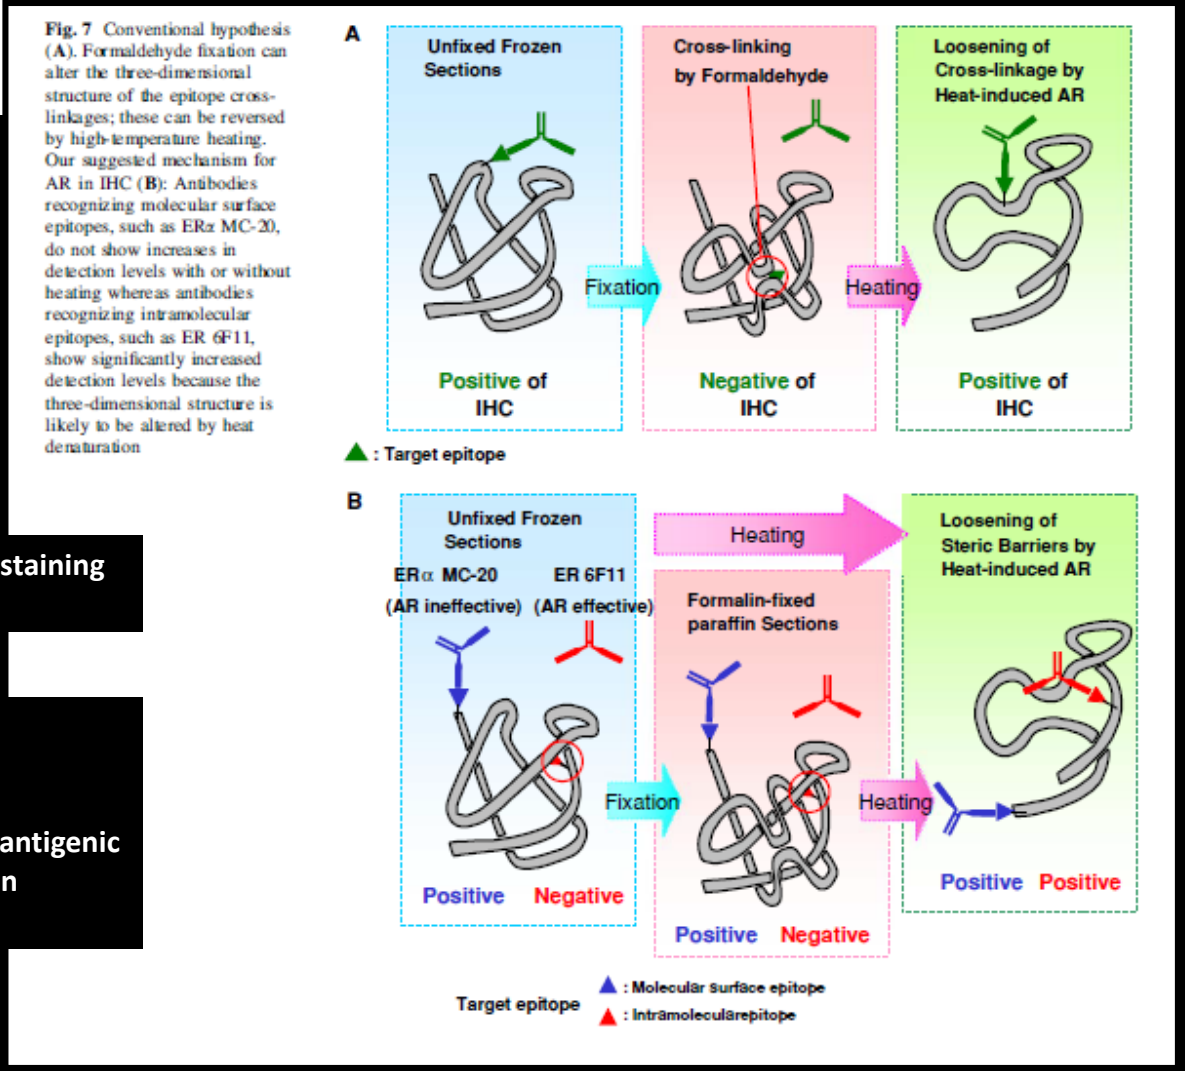

Fig. 7 Conventional hypothesis (A). Formaldehyde fixation can alter the three-dimensional structure of the epitope cross-linkages; these can be reversed by high-temperature heating. Our suggested mechanism for AR in IHC (B): Antibodies recognizing molecular surface epitopes, such as ERα MC-20, do not show increases in detection levels with or without heating whereas antibodies recognizing intramolecular epitopes, such as ER 6F11, show significantly increased detection levels because the three-dimensional structure is likely to be altered by heat denaturation

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Efficient HIER depends on several parameters:

- ❑ pH of the HIER buffer
- ❑ Temperature
- ❑ Time
- ❑ Elementary nature of the HIER buffer (e.g., Citrate; TRIS; EDTA; TE)

Less sensitive to routinely fixed tissue (formalin) compared to enzymatic pre-treatment

> 95% of all commonly used antibodies require HIER

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

The purpose of antigen retrieval is to unmask antigen epitopes /restore antigenic determinants and recover immuno-reactivity

Antigen retrieval procedures for formalin fixed tissue:

- ❑ **Heat Induced Epitope Retrieval (HIER)**
- ❑ **Tissue digestion using proteolytic enzymes**
- ❑ Combined pre-treatment (HIER with proteolytic digestion)

Proteolytic enzymes cleave more or less specific amino acid sequences within peptide chains (and not covalent cross-links formed in tissues during formalin fixation).

→ Improves penetration of immuno-reagents into tissue structures and enhance accessibility to the epitopes of interest.

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Enzymatic digestion - the problem?

A significant proportion of Labs still use enzymatic pre-treatment for e.g, “old” markers as cytokeratins and S100 introduced back in 1980-1990.

Only few markers require enzymatic digestion for “optimal performance”.

Only few markers require enzymatic digestion for “optimal performance”.

NQC Run 64, 2022:
Desmin

The Ventana/Roche RTU system based on mAb clone DE-R-11 (760-2513) was the most widely used RTU system applied by 140 laboratories. One laboratory used it on the Dako Omnis with a sufficient result. An overall pass rate of 71% was seen and 54% optimal.
Optimal results could only be obtained by use of laboratory modified protocol setting using HIER in CC1 as single retrieval method or a combined method using HIER in CC1 followed by proteolysis in either P2 or P3 (see Table 4). If the protocols were performed accordingly to the recommendations provided by Ventana, using proteolysis as a single retrieval method the 49 protocols submitted only provided a pass rate of 22%, none being optimal. Laboratories using modifications for pre-treatment using HIER +/- proteolysis improved the pass rate to 96% (86/90).

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

”Optimal” enzymatic digestion depends on:

Enzyme type

Concentration

Time

Temperature

Fixation type & time

Tissue type

Most common Enzymes

Proteinase K
Pronase XIV
Pronase XXIV
Pepsin
Trypsin

Difficult to control and to standardizes within routine LAB

Short time formalin fixation = gentle proteolysis
Long time formalin fixation = prolonged proteolysis

Markers requiring enzymatic pretreatment :

FVIII (poly), LMV CK (CAM 5.2), PAN CK (MNF116), EGFR (various), TCR-β (8A3)……..

Extracellulare matrix proteins (COLL-III (poly), Laminin (poly) and COLL-IV (CIV-22) ……..

≤ 2% of all commonly used antibodies require enzymatic pre-treatment

Choice of proteolytic enzyme

	Trypsin (Biocare, RTU) 40`	Pepsin (ZytoVision, RTU-H) 15`	Proteinase K (Dako, RTU) dil. 1:4 / 5`
TCR-β, 8A3, 1:200 RR Tonsil			Ubiquitin, Ubi-1 1:750 Liver/ Mallory bodies			Neutrophil Elastase, NP57 1:1000 Tonsil			
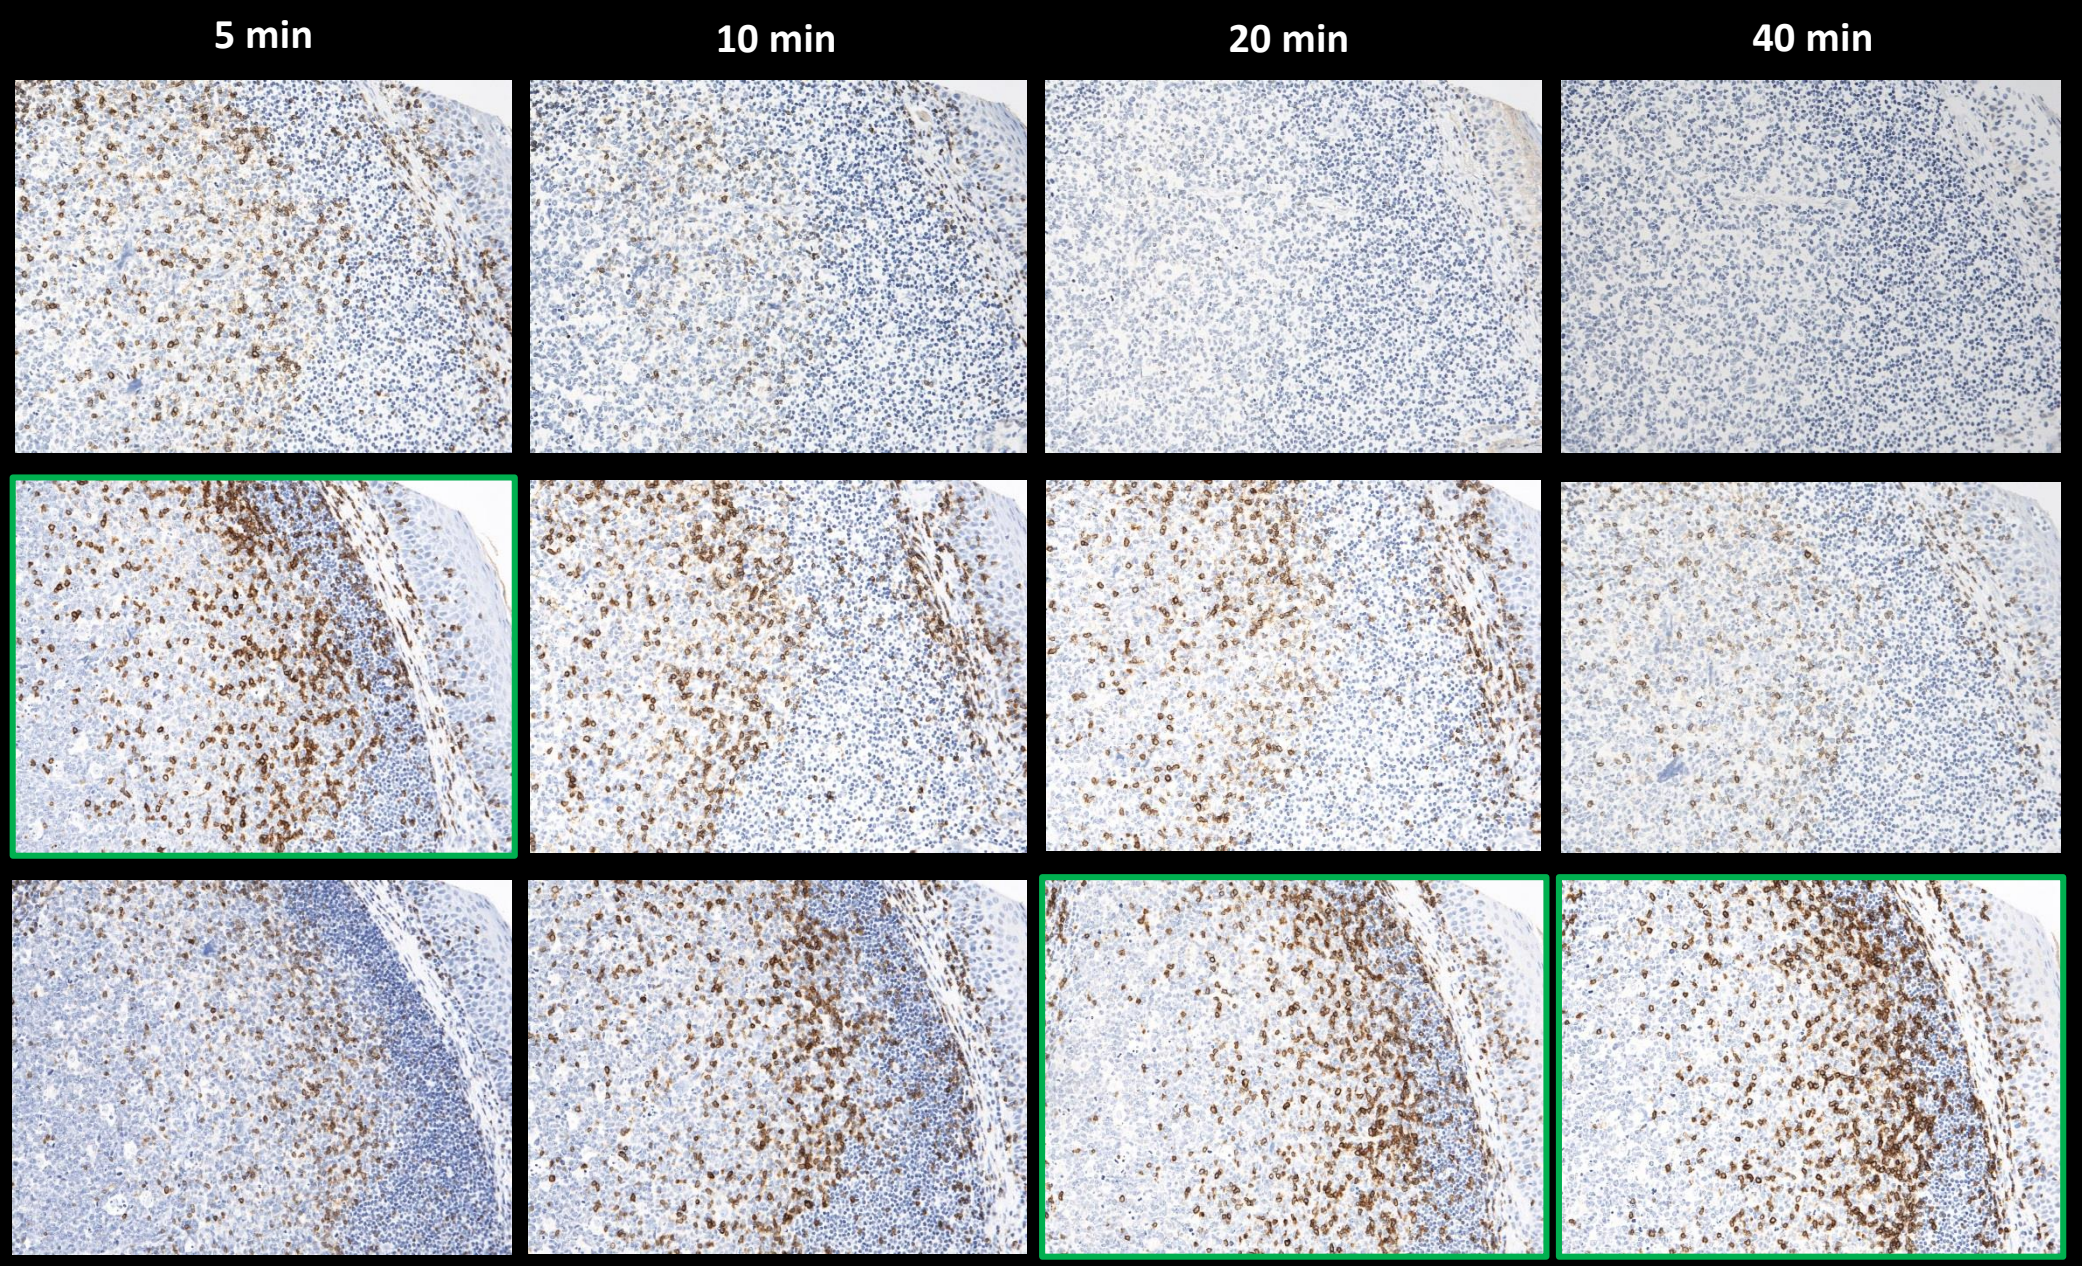
Proteolytic enzyme & digestion time ?

Tonsil NBF 48h

Digestion temp. 32°C



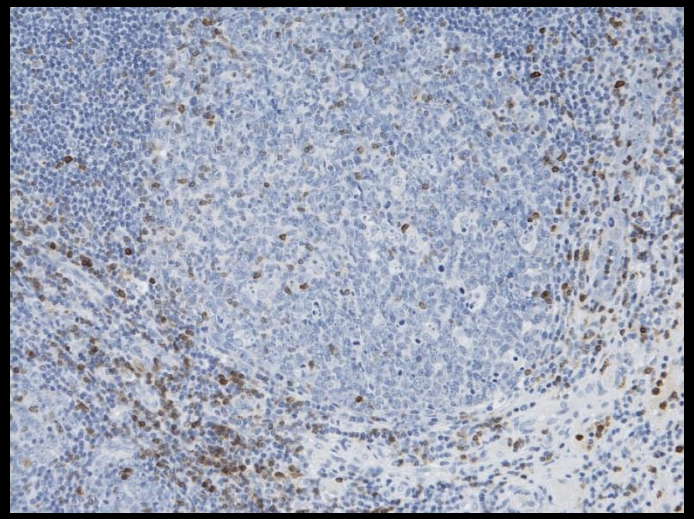
TCR-β clone 8A3 (1:200 RR) / Flex+ (Omnis)

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

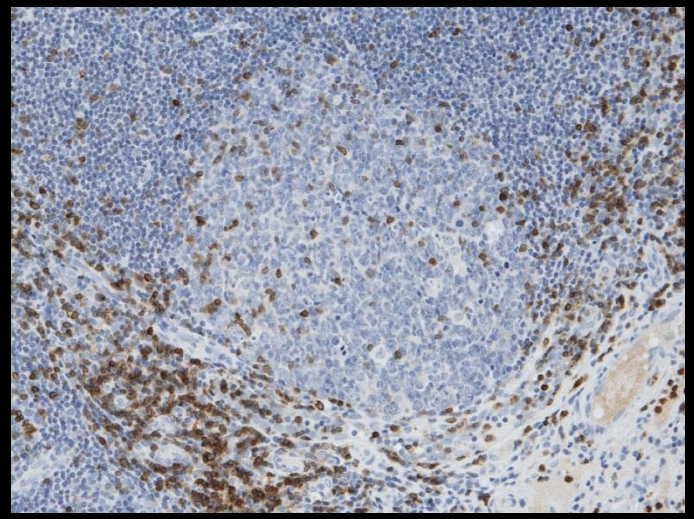
Proteolytic enzyme & digestion temperature ?

TCR β clone 8A3 (1:200 RR) / Flex+ (Tonsil NBF 48h)

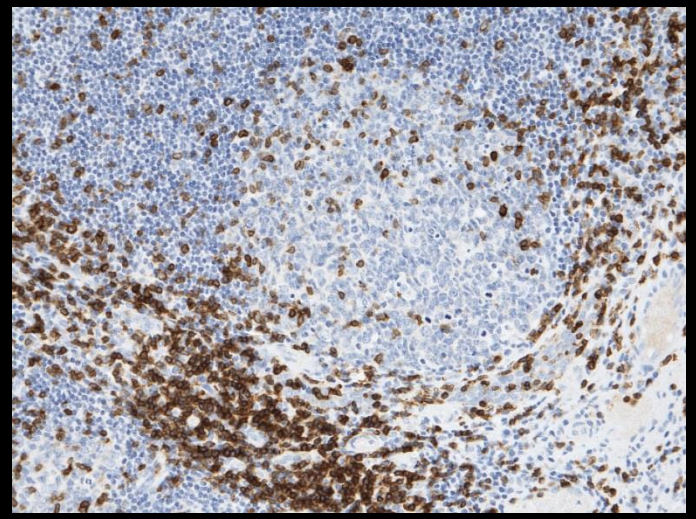
Trypsin Digestion temp. 4°C (10 `)



Trypsin Digestion temp. 24°C (10`)



Trypsin Digestion temp. 37°C (10`)



Increased intensity of TCR β positive T-cells

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Enzymatic digestion (Influence of fixation time)

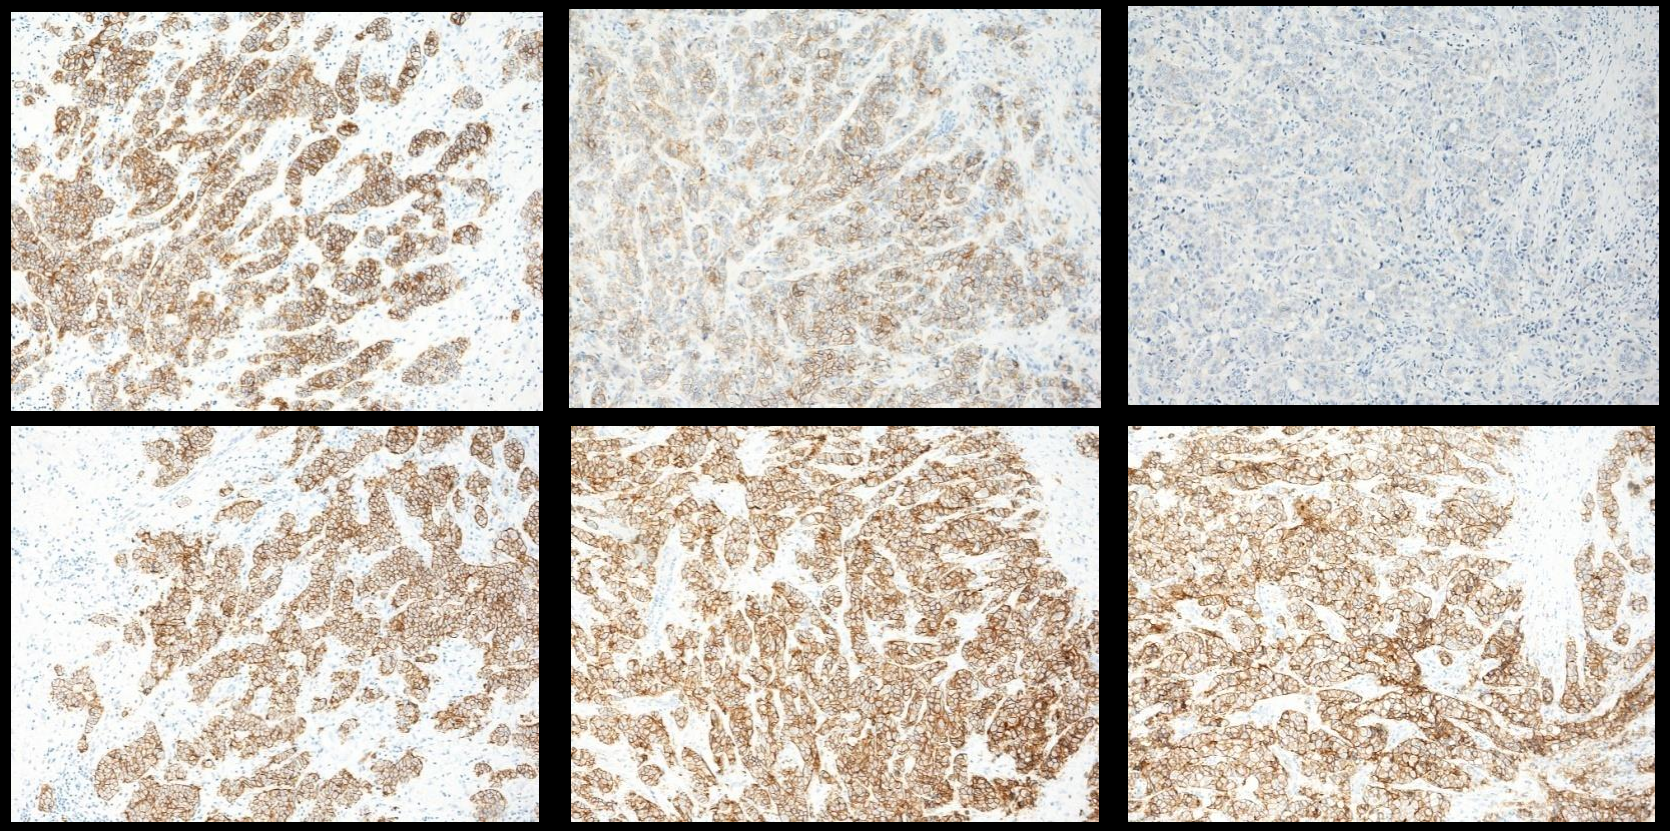
EPCAM, clone MOC-31, dilution 1:20

Pepsin / (Dako, S3002)

10 min/37°C

HIER , Low pH (S1700)

20 min / 97°C



NBF 24 h | **NBF 48 h** | **NBF 120h**

Adenocarcinoma (Breast) fixed in 10% Formalin

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg [1,2] · Søren Nielsen [1]

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

Problems related to the choice of antigen retrieval method :

- Use of non-alkaline HIER buffer (low pH buffer)
- Use of inefficient / too short HIER period
- Use of no / enzymatic pre-treatment instead of HIER
- **Use of excessive retrieval procedure → impaired morphology**

False positive or false negative results

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Proteolytic pretreatment (excessive retrieval procedures)

- over digestion (e.g. not calibrated to the fixation time in NBF)

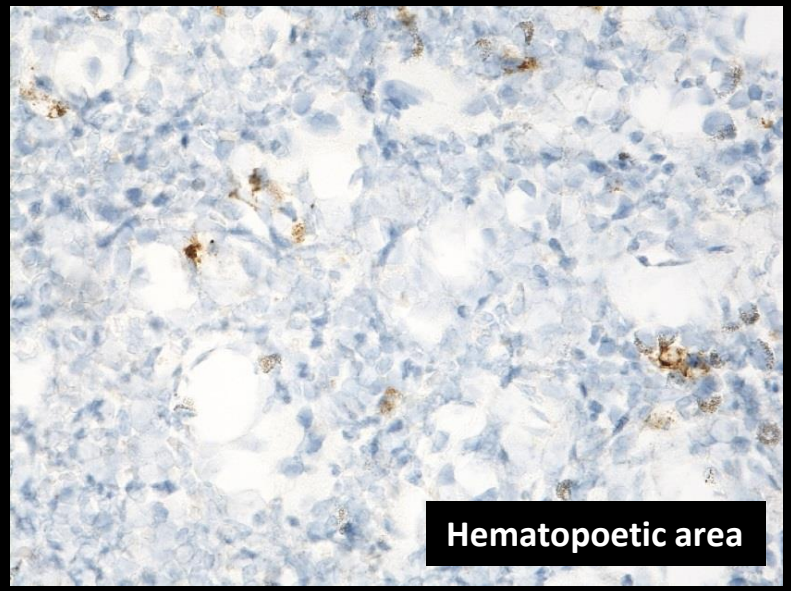
HIER (excessive retrieval procedures)

- too high temperature for too long time especially in alkaline retrieval buffers

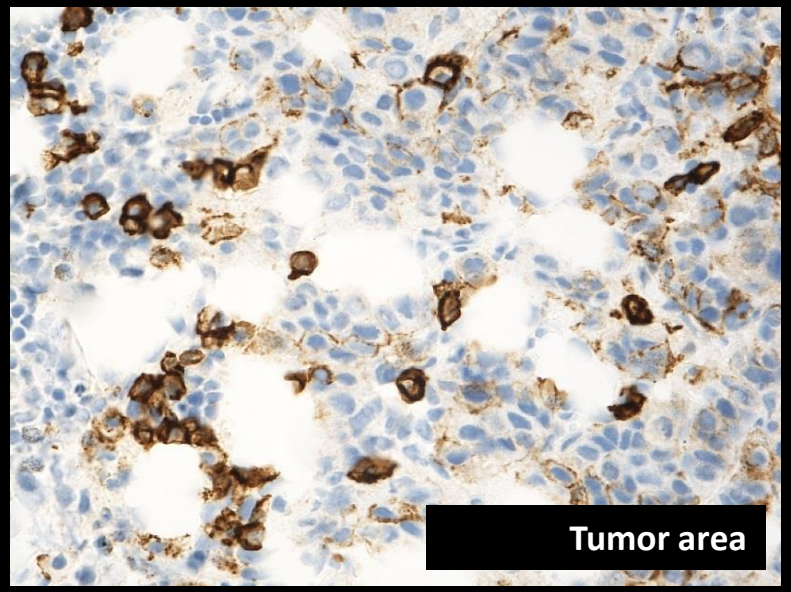
HIER applying standard procedures (excessive retrieval procedures)

- fragile tissue/cell material (cell clot´s)

Bone marrow trephine: Metastatic breast carcinoma



Hematopoetic area

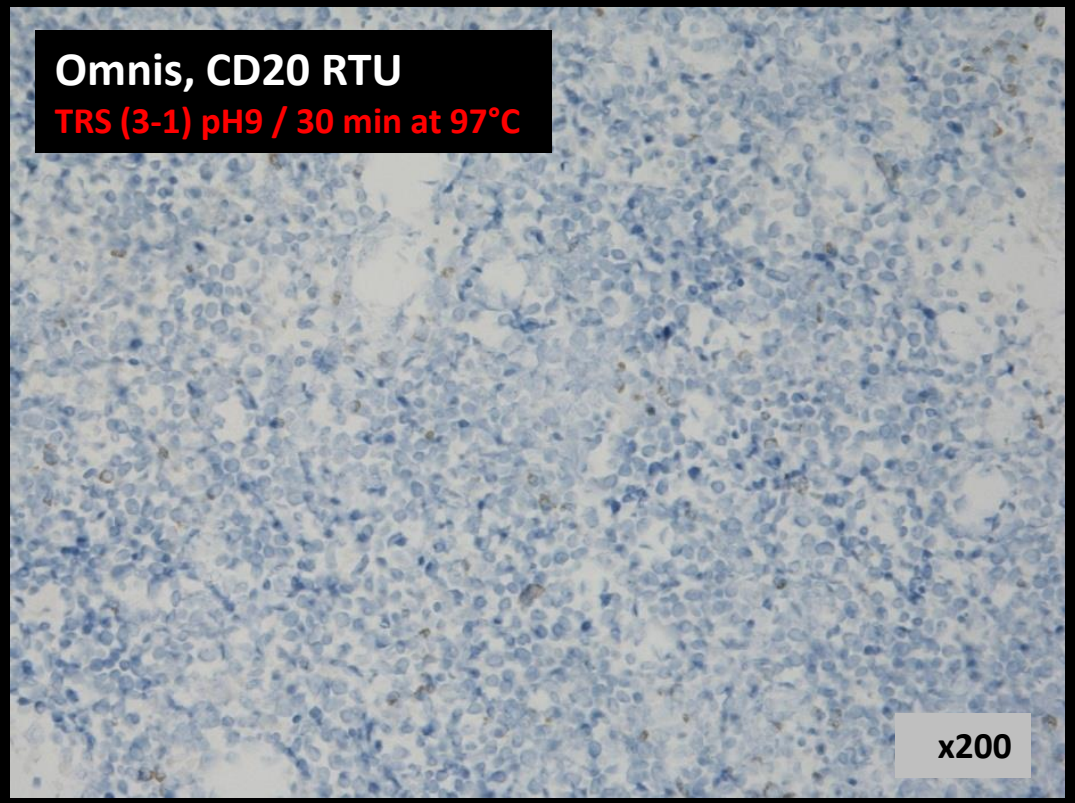


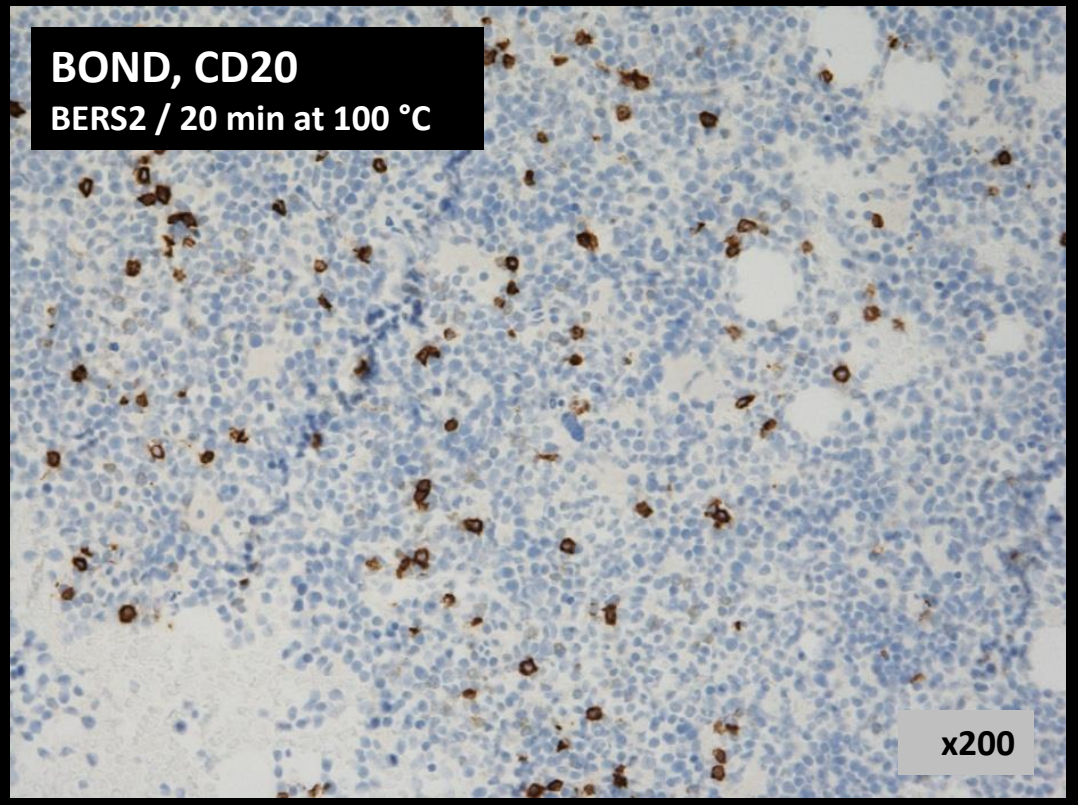
Tumor area

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

CD20 clone L26

Bone Marrow Coagulum/Clot (fixed for 24h in NBF)





HIER settings: Recommendations of the manufacturer`s

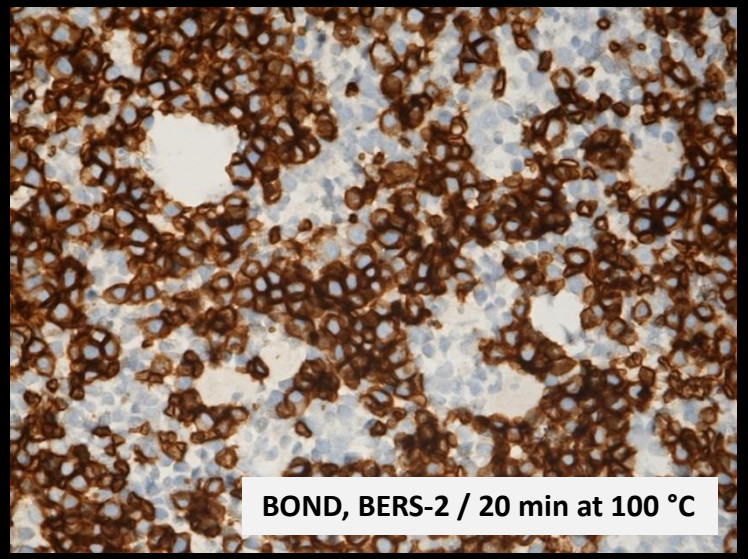
Technical aspects of immunohistochemistry & pitfalls - Analytical phase

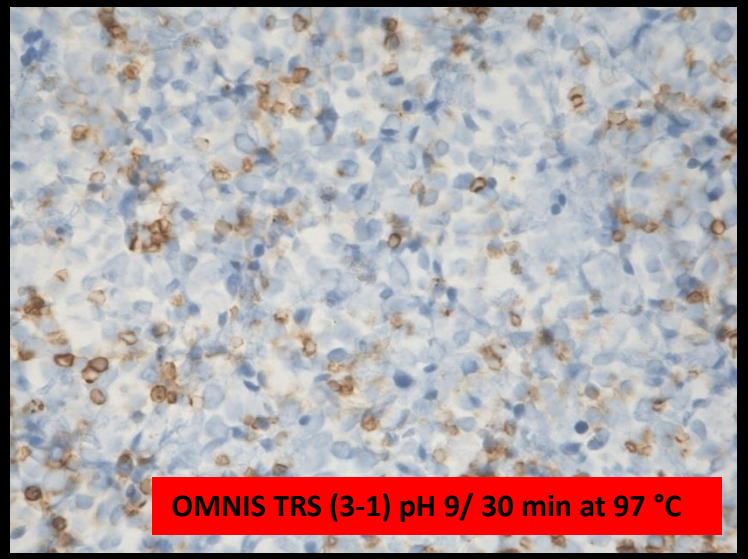
Bone marrow clot (NBF 24h)

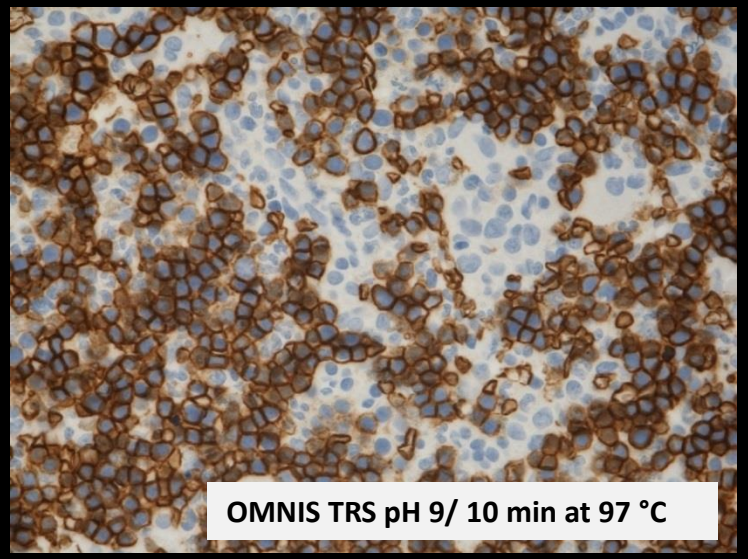
Morphology ?

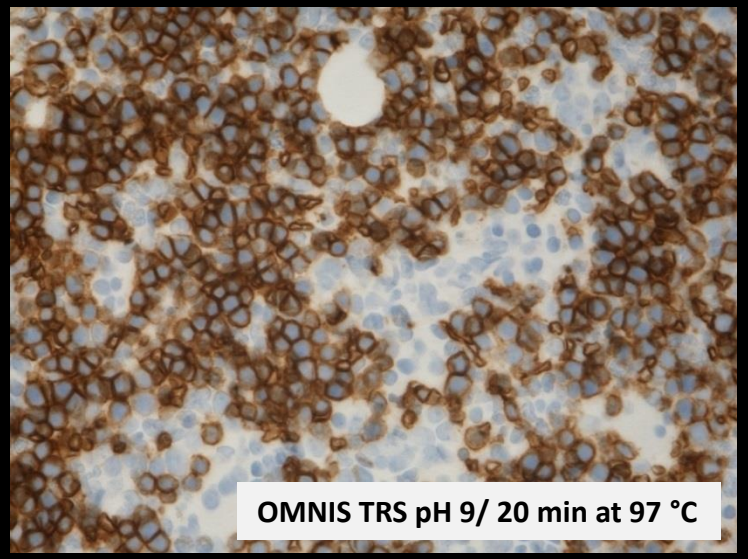
Glycophorin A clone JC159 (1:500)

Flex+









Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Bone Marrow cloth (NBF 24 h)

Morphology ?

TRS (3-1) High pH 9, 24` at 97C,

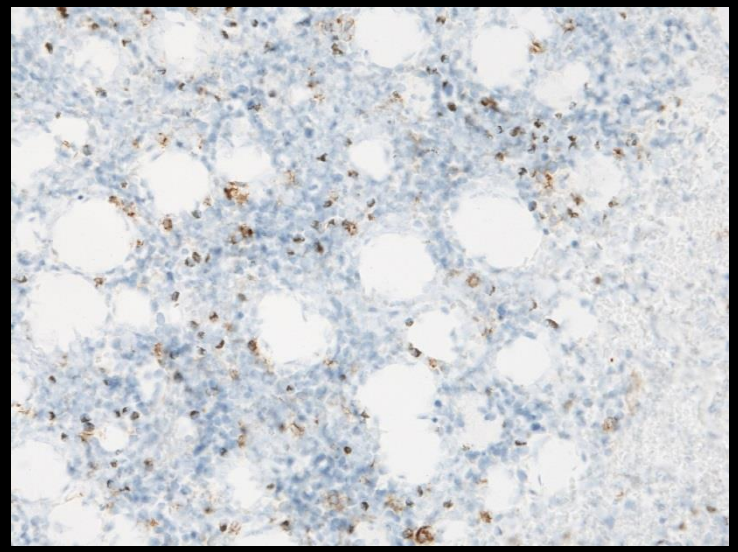
Agilent/Dako (Omnis, Flex+)

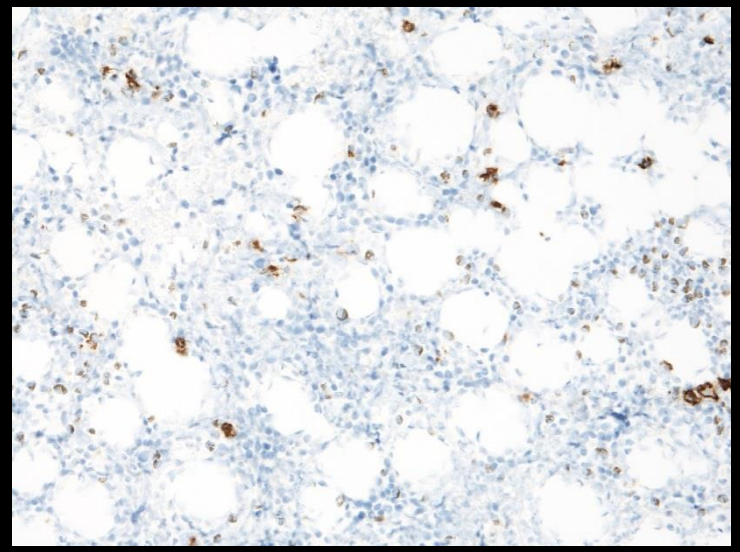
HIER buffer H, 24` at 97C

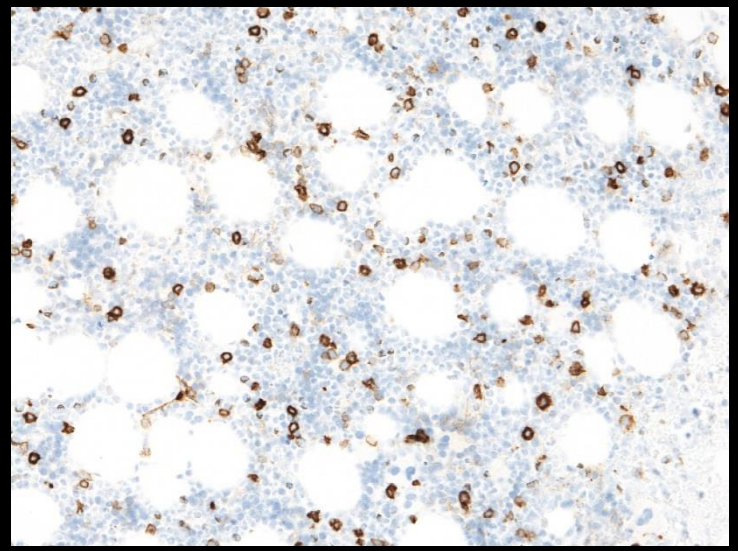
Thermo S./ LabVision (Omnis, Flex+)

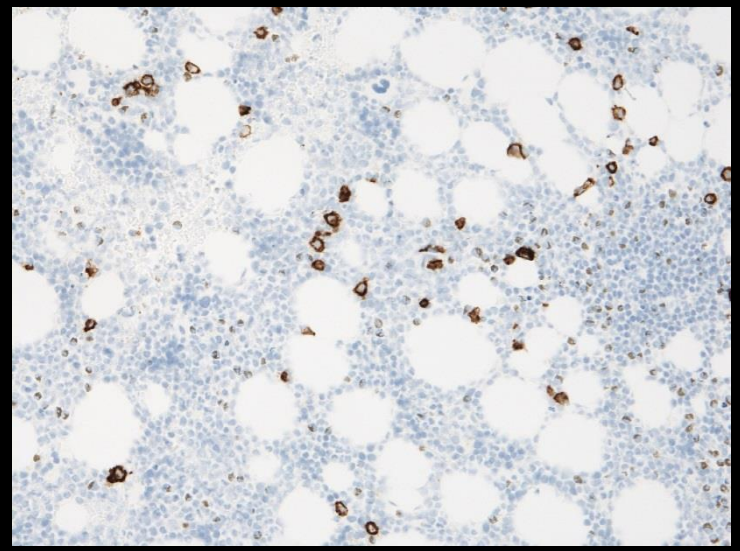
CD117, EP10 (1:25 RR)

CD138, B-A38 (1:1000)









Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Bone marrow clot

AS: PT-Link, High pH buffer´s at 97℃ / 20`

Morphology ?

High pH (3-1) (Dako)

Recommended settings (pre-start temperature):

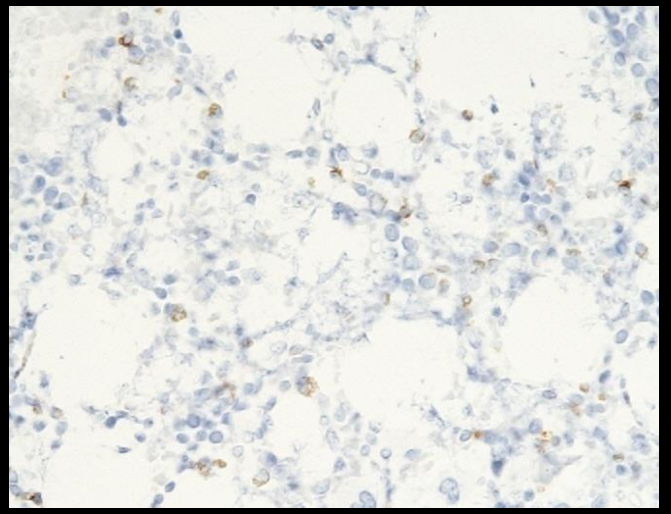
65℃

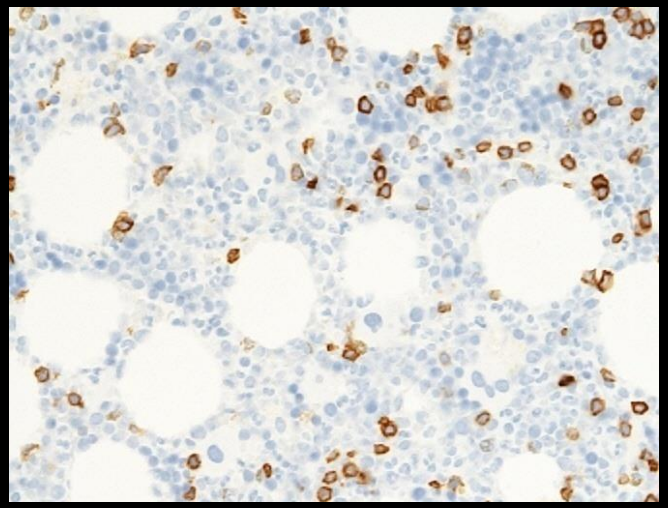
HIER buffer H (LabVision)

Recommended settings (pre-start temperature):

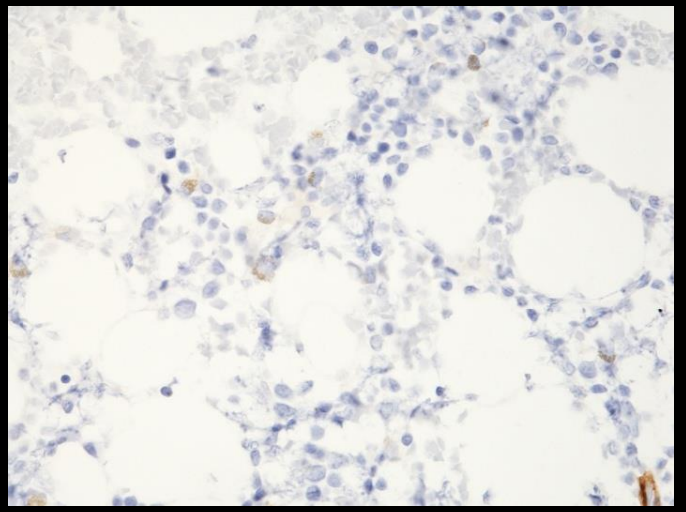
85℃

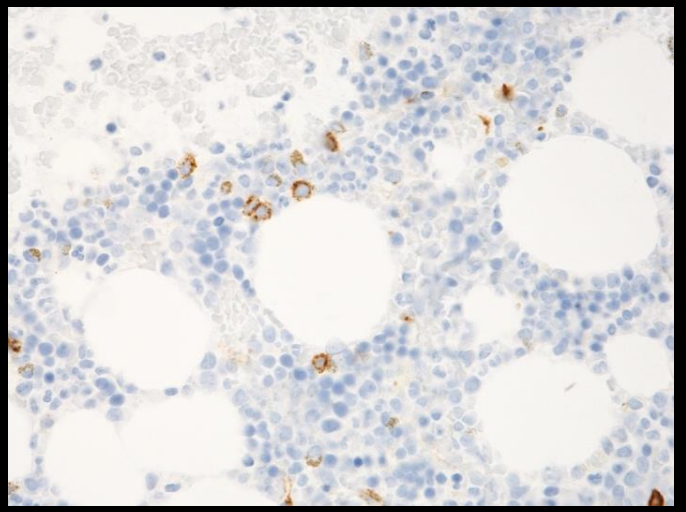
CD5 clone SP19





CD34 clone QBEND-10





Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Excessive retrieval on bone marrow material – what to do ?

- **Optimize pre-analytic conditions**

  At arrival in our department , fresh fixative is added to the bone marrow specimens and a post fixation step for 24-48h at 42°C (stirring) has improved morphology.

  Never dry cut slides horizontally – always vertically at room temperature for 30-60 min followed by 30-60 min at 60°C.

  Decalcifying agent (shorten time and/or substitute ?)

- **Shorten HIER time**

  Labor intensive: Require validated protocols for each hematological marker and might require two different protocols depending on the material e.g., solid tissue (lymph nodes) versus bone marrow material.

- **Use a more gentle HIER buffer (if possible)**

- **Consider change platform providing appropriate buffers not causing morphological problems as e.g., the TRS High pH buffer (Dako).**

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Antibody company (producer) - Quote:

In the world of next generation immuno-oncology research, having confidence in your immunoassay results is vital.

Unfortunately, 75% of antibodies in today's market are non-specific or simply do not work at all.

Primary Antibodies

PERSPECTIVE

Commercial Antibodies: The Good, Bad, and Really Ugly

John R. Couchman
Biomedicine Institute, University of Copenhagen, Biocenter, Copenhagen, Denmark

SUMMARY The range of antibodies available commercially grows ever larger. Perhaps as a consequence, quality control is not always what it could and should be. Investigators must be aware of potential pitfalls and take steps to assure themselves that the specificity of each antibody is as advertised. Additionally, companies should provide the necessary information about the antigen and antibody to investigators, including references, so that the appropriate controls can be included. (J Histochem Cytochem 57:7–8, 2009)

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

37% insuff.

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

Problems related to the choice and/or use of the primary antibody:

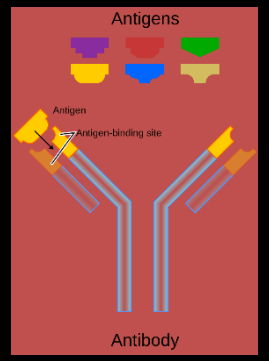
- **Inappropriate primary antibody**
  - Provide low sensitivity/specificity
- **Appropriate primary antibody**
  - Inapp. titre (too low or too high concentration)
- **Platform (stainer) dependent antibodies**
  - Provide low sensitivity / specificity

False positive or false negative results

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Parameters affecting antibody-antigen reactions in tissue

Antibody choice – Sensitivity/Specificity
Antibody Titer
Antibody performance related to the chosen automated platform
Antibody diluents



Incubation time
Incubation temperature
Sensitive to endogenous peroxidase blocking e.g., BCL6 (PG-B6p) and CD4 (1F6)

Storage of concentrated primary antibodies
Storage of diluted primary antibodies

Provided that efficient antigen retrieval has been performed and a sensitive detection system has been used

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody provides low sensitivity

mmAb indicates mouse monoclonal antibody; rmAb, rabbit monoclonal antibody.

Demonstrated that UPII klon BC21 outperforms UPIII Abs and at present should be the preferred choice of UP marker.

However, should be used in a panel with other Urothelial markers as e.g., GATA3 due to moderate analytical sensitivity (and due to positivity in a minority of nonurothelial carcinomas - app. 3%)

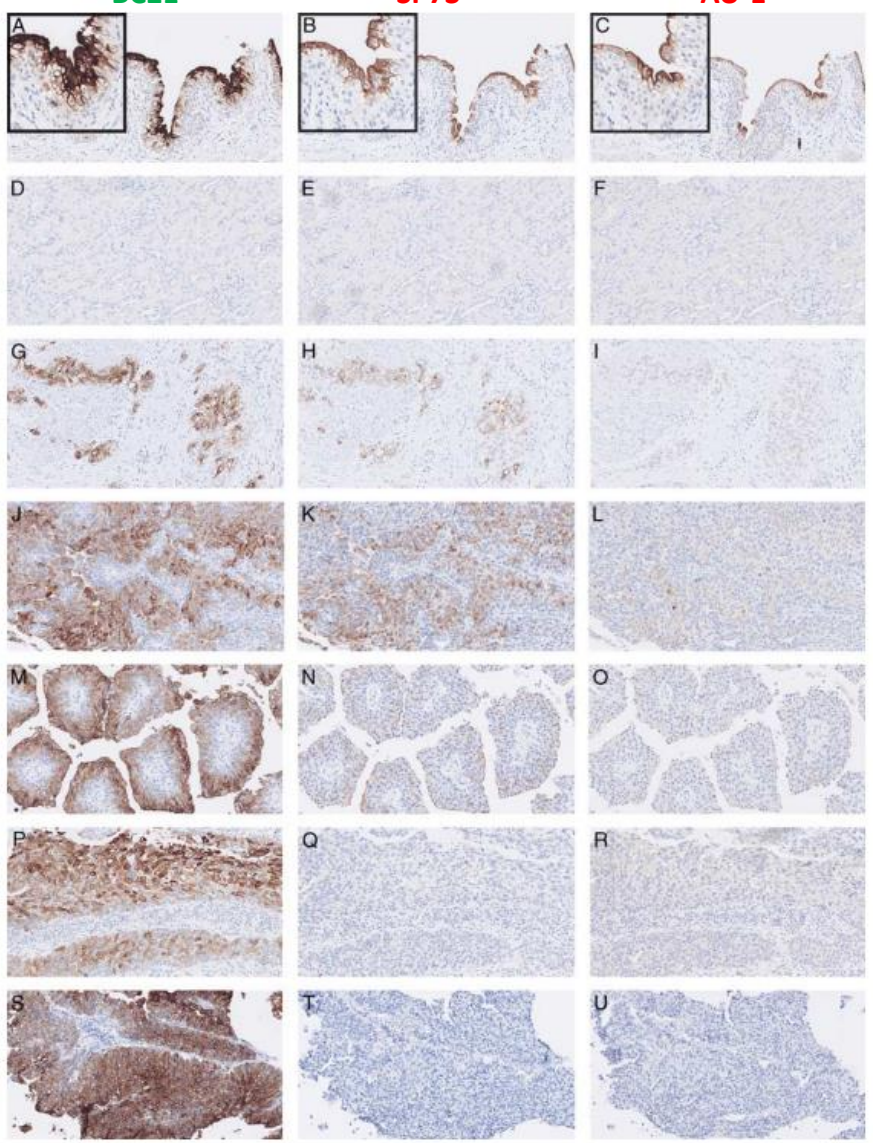

FIGURE 1. Examples of UP staining in normal tissue and UCs with various intensity using UPII mmAb clone BC21 (A, D, G, J, M, P, S), UPIII rmAb clone SP73 (B, E, H, K, N, Q, T), and UPIII mmAb clone AU-1 (C, F, I, L, O, R, U). A–C: normal urethra, insert high powerfield. D–F: normal kidney. G–I, J–L, M–O, P–R, and S–U: different UCs. mmAb indicates mouse monoclonal antibody; rmAb, rabbit monoclonal antibody; UCs, urothelial carcinomas; UP, uroplakin.

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody provides low specificity and/or poor signal-to-noise ration

***Liau J-Y et al.: Appl Immunohistochem Mol Morphol .* 2016 Jan;24(1):57-63**

Demonstrated that neuroendocrine tumors (NET´s) from a large variety of organs were immuno-reactive with the two less specific antibodies (pAb Proteintech & mAb MRQ-50) - cross-reacting with other PAX proteins

Also, all NET`s were immuno-negative with the two monoclonal antibodies raised against the C-terminal part of PAX8 protein (PAX8R1 & BC12)

Moretti L et al. : *Mod Pathol. 2012; 25 : 231-236*

Demonstrated that an N-terminal PAX-8 polyclonal antibody cross-react with N-terminal region of PAX-5 and is responsible for reports of PAX-8 positivity in malignant lymphomas.

Also, PAX8 mRNA levels were not detected in any of the B-cell lymphoma cell lines studied. These results indicate that benign and malignant B-cells do not express PAX8.

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

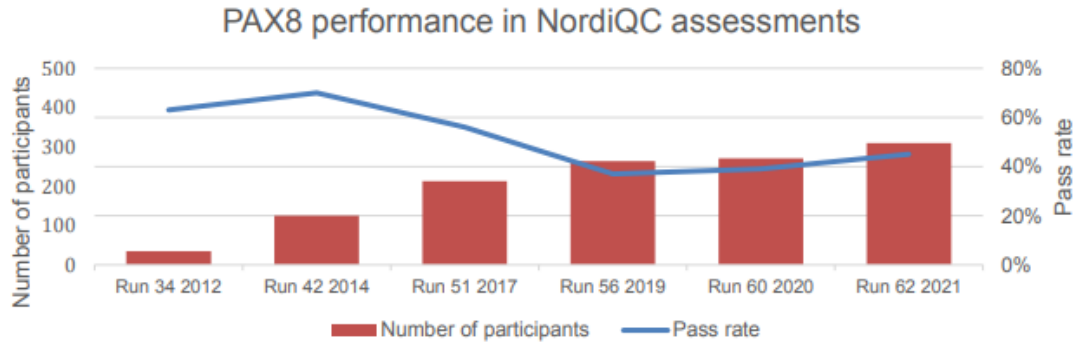
Graph 1. **Proportion of sufficient results for PAX8 in the six NordiQC runs performed**



Conclusion

Optimal staining results could be obtained with the rmAb clones **EP298**, **SP348**, **ZR-1**, **BC12**, **IHC048** and **RM436**. Irrespective of the clone applied, efficient HIER, use of a sensitive 3-step polymer/multimer based detection system and careful calibration of the primary antibody were the most important prerequisites for an optimal staining result.

The rmAbs clones **EP298**, **SP348** and **ZR-1** gave encouraging results and a high proportion of sufficient results on the main fully automated platforms and no cross-reaction with e.g. PAX5 was observed. In contrast, the mAb clone **MRQ-50** provided a poor performance especially on the Ventana BenchMark and Dako Omnis platforms and at the same time also labelled PAX5 in B-cells. The **EP331** also provided a low pass rate due to aberrant nuclear staining reaction in non-PAX8 expressing cells and poor signal-to-noise ratio.

mAb clone MRQ-50/pAbs cross react with other Pax proteins in the family (e.g. PAX5):

Should we use primary antibodies that cross react with other proteins in the same family ?

Would we accept cross-reactivity in the family of CD`s and CK`s - e.g., CD20 to CD3 or CK5 to CK8 ?

BC12 (platform dependent)

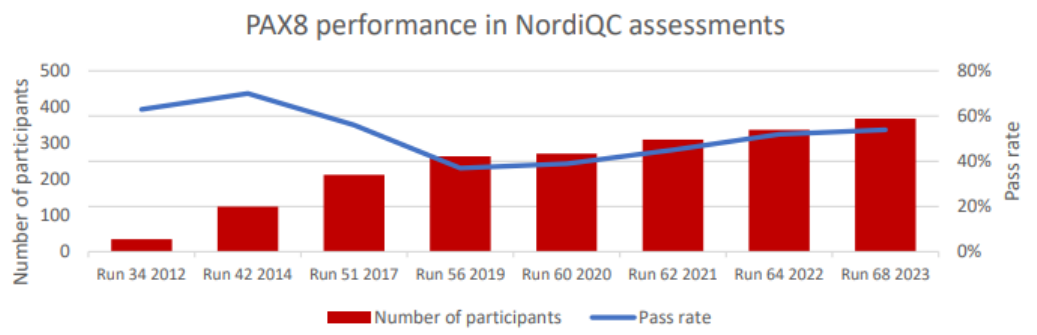
“ZR1” (lot variations/antibody diluent dependent)

SP348

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody provides low specificity and/or poor signal-to-noise ration

Graph 1. **Proportion of sufficient results for PAX8 in the eight NordiQC runs performed**



Conclusion
Optimal staining results could be obtained with the rmAb clones **SP348, ZR-1, MXR013, GR002, QR016,** and **RM436**. Irrespective of the clone applied, efficient HIER, use of a sensitive 3-step polymer/multimer based detection system and careful calibration of the primary antibody were the most important prerequisites for an optimal staining result.
The rmAb clone **SP348** gave encouraging results and a high proportion of sufficient results on the main fully automated platforms and no cross-reaction with e.g. PAX5 was observed. No optimal results were however observed on the Bond Platform. The mAb clone **MRQ-50** provided a poor performance especially on the Ventana BenchMark and Dako Omnis platforms and at the same time also labelled PAX5 in B-cells. The **EP331** also provided a low pass rate due to aberrant nuclear staining reaction in non-PAX8 expressing cells and poor signal-to-noise ratio.

PAX8 (Run 68, 2023)

Where are we now ?

Cross-reactivity with PAX5 resulting in a distinct nuclear staining reaction of B-cells for antibodies raised against the N-terminal part of PAX8 was seen in 34% (125/368) of the returned slides (see Figs. 5a and 5b). This reaction applied for all polyclonal Abs and mAb clones MRQ-50, C12A32, IHC008, H5A8, PAX8R1 and rmAb 2774R. Within the last couple of years well-performing rmAbs without cross reactivity has been introduced to the market (see Table 1). Based on this, cross-reactivity with PAX5 was downgraded due to the risk of misinterpretation in the diagnostic work-up of CUP. The diagnostic challenges and different reaction profiles related to the choice of PAX8 Ab has e.g. been described by Kamaljeet Singh et al.; *AIMM 2020, Aug;28(7):558-561; Comparison of PAX8 Expression in Breast Carcinoma Using MRQ-50 and BC12 Monoclonal Antibodies* and Tacha D et al., *AIMM 2013, Jan;21(1):59-63; PAX8 mouse monoclonal antibody [BC12] recognizes a restricted epitope and is highly sensitive in renal cell and ovarian cancers but does not cross-react with b cells and tumors of pancreatic origin.*

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody provides low specificity and/or poor signal-to-noise ration

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Poorly calibrated primary antibody (false negative or false positive)

The right primary antibody

The right protocol (AR procedure and detection system)

Poorly calibrated primary Ab ?

Tissue controls are the key element

Normal skin is the preferred positive control for GCDFP-15. The epithelial cells of the eccrine sweat glands must show an as strong as possible positive cytoplasmic staining reaction, while all other cells should be negative.

Normal breast tissue can also be used as control in which epithelial cells of the ductal glands must show an as strong as possible staining reaction.

Background staining may be seen in vicinity of highly positive tissue structures (e.g. eccrine sweat glands)

Gross cystic disease fluid protein-15 (GCDFP-15)

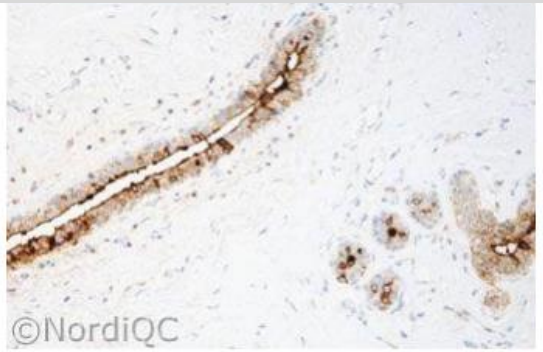

Fig. 1a
Optimal staining for GCDFP-15 of the breast hyperplasia using the mAb clone 23A3 optimally calibrated as a concentrate, HIER in an alkaline buffer and a polymer based detection system. The majority of the ductal epithelia cells show a distinct moderate to strong cytoplasmic staining reaction. Also compare with Fig. 2a – same protocol.

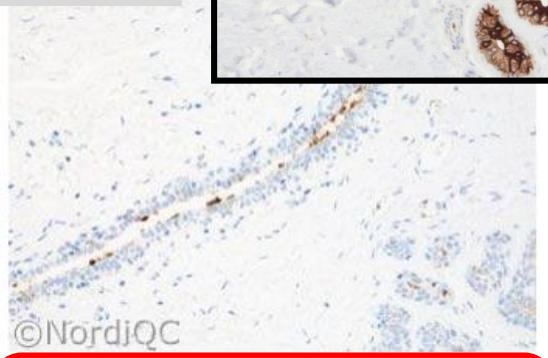

Fig. 1b
Insufficient staining for GCDFP-15 of the breast hyperplasia applying the mAb clone 23A3 as a concentrate using exactly the same protocol settings as used in Fig 1a, except for a 20 fold dilution of the primary antibody. The proportion and the intensity of the cells demonstrated are significantly reduced compared to the result in Fig. 1a. Also compare with Fig. 2b – same protocol.

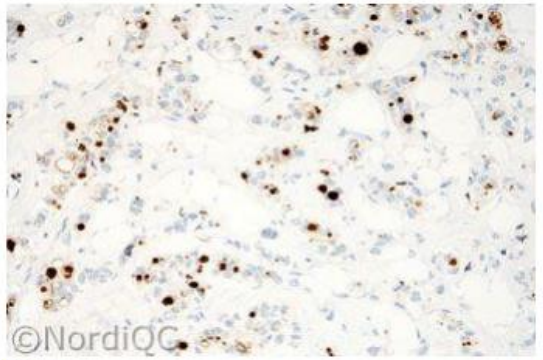

Fig. 2a
Optimal staining for GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1a.
The majority of the neoplastic cells show a moderate to strong dot-like cytoplasmic staining reaction.

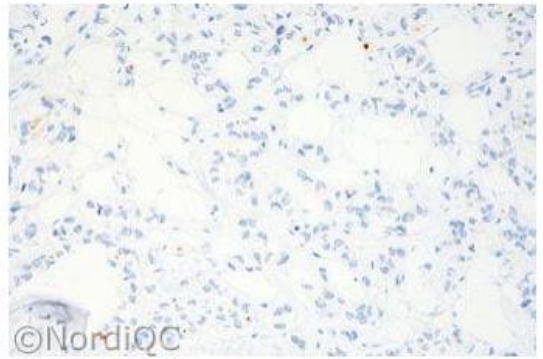

Fig. 2b
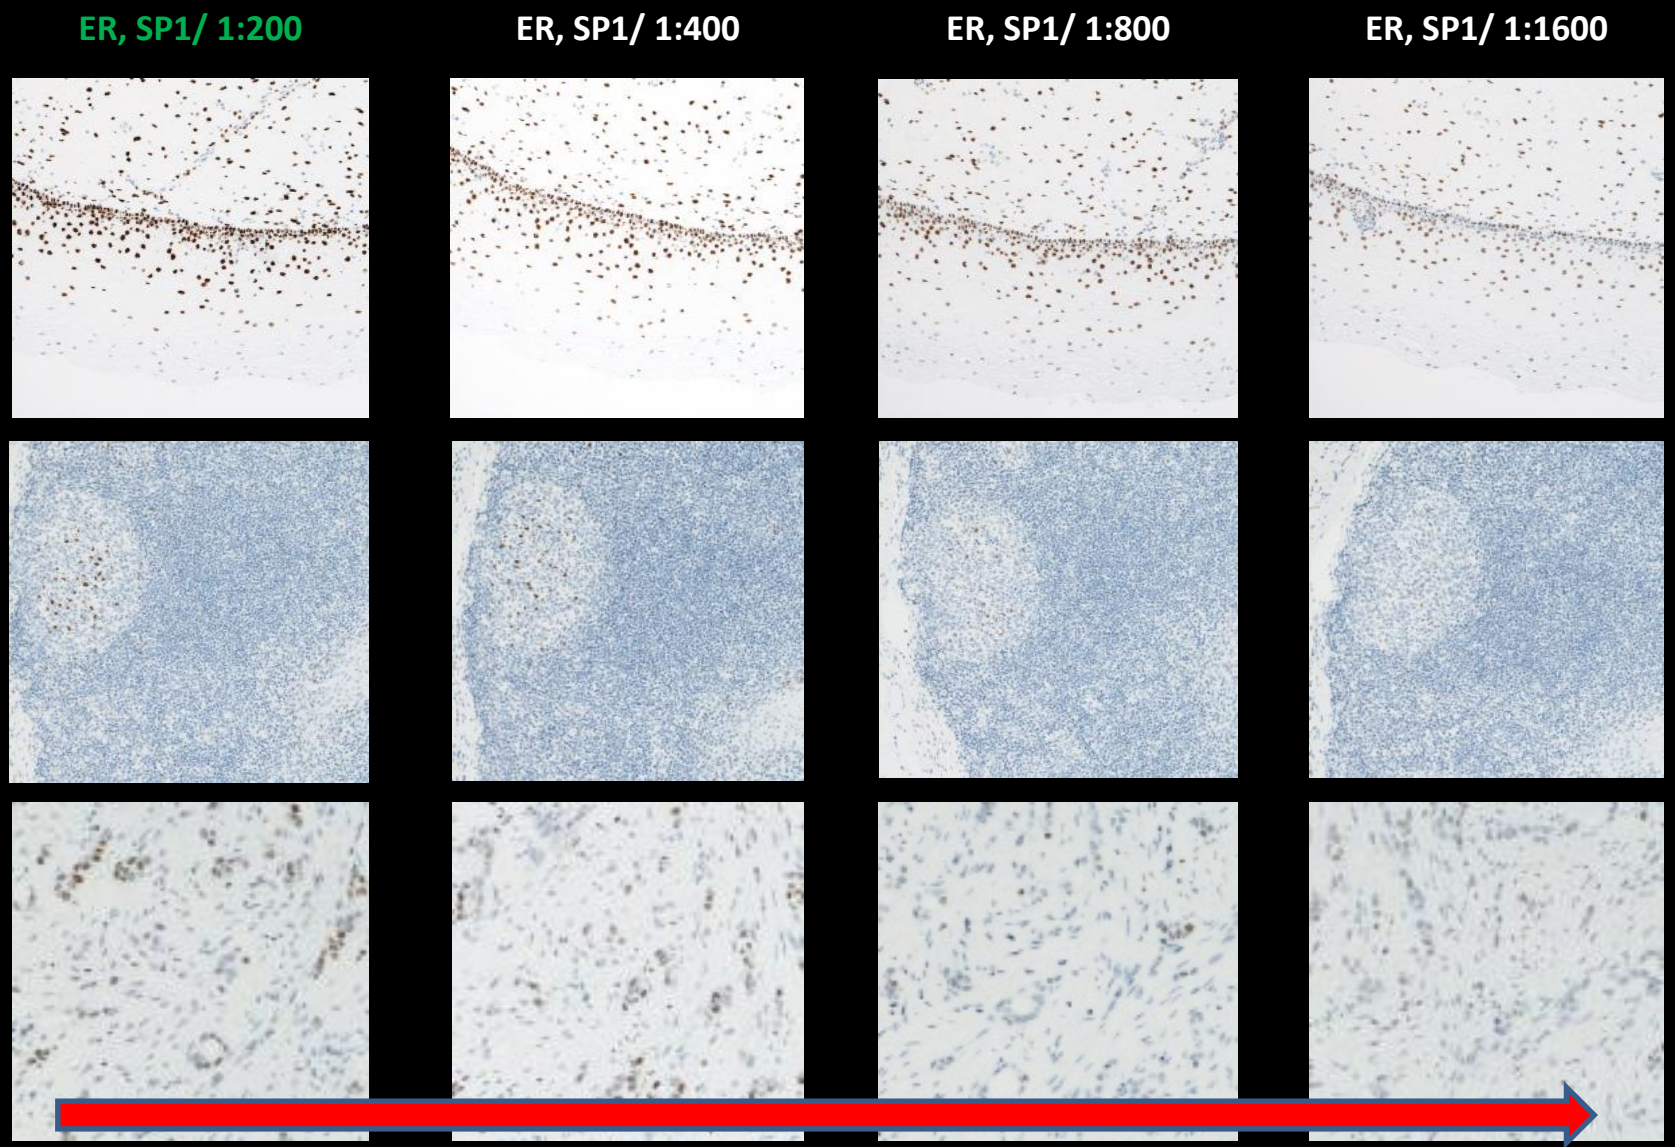
Insufficient staining GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1b. - same field as in Fig. 2a.
Only scattered neoplastic cells show a faint dot-like reaction.

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody poorly calibrated (false negative)

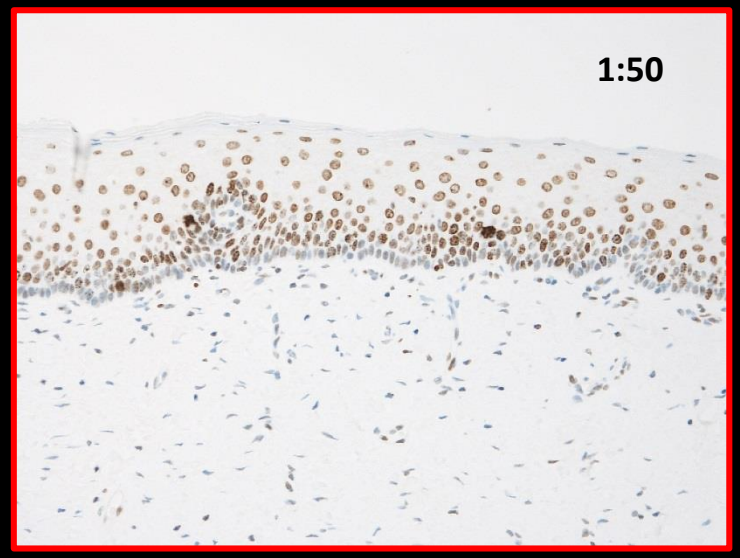


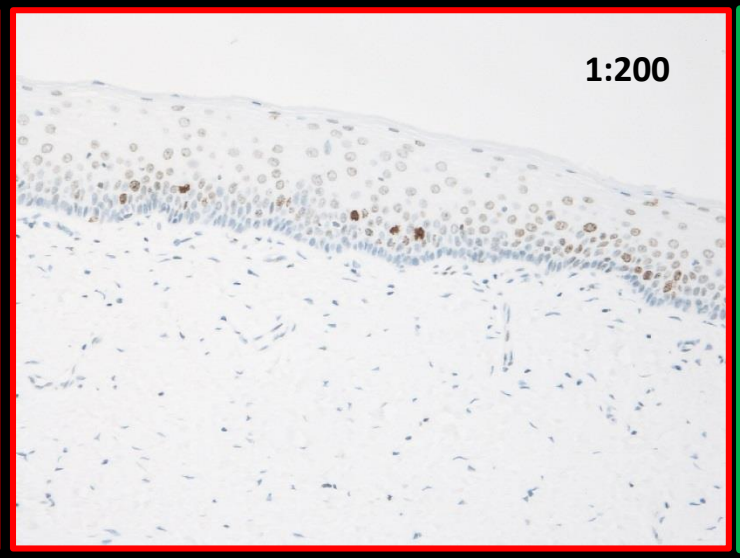
High pH 24`, Flex+Rabbit

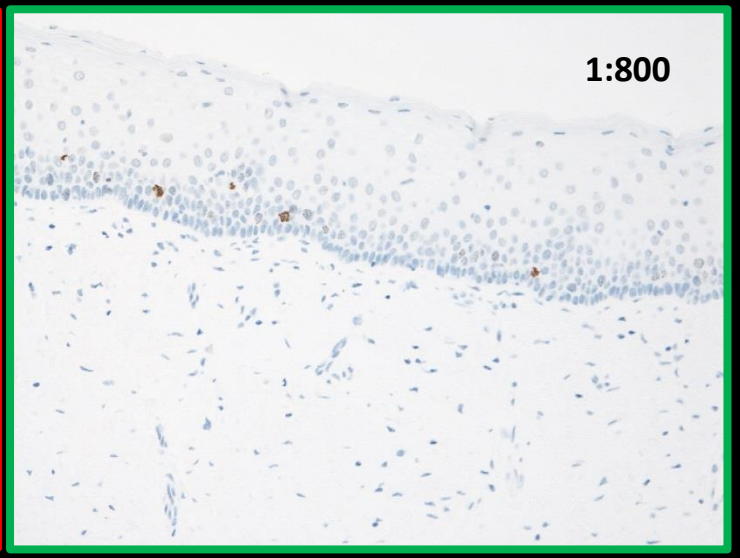
Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody poorly calibrated (false positive)

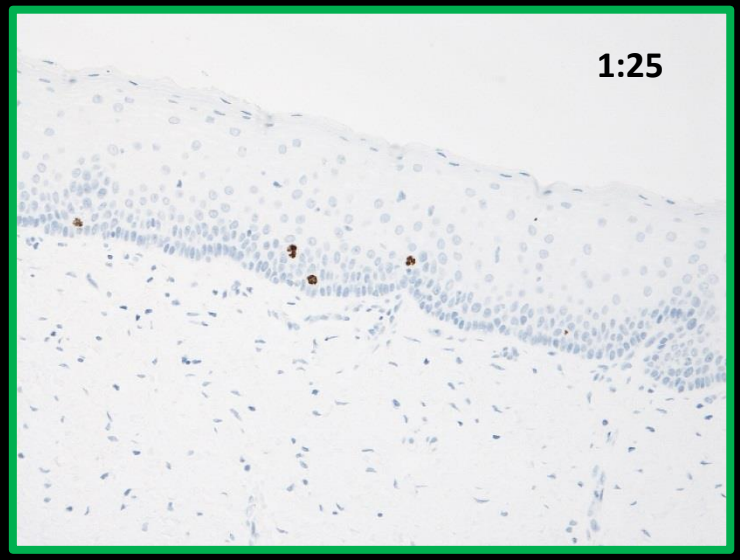
PHH3, poly (Cell Marque)

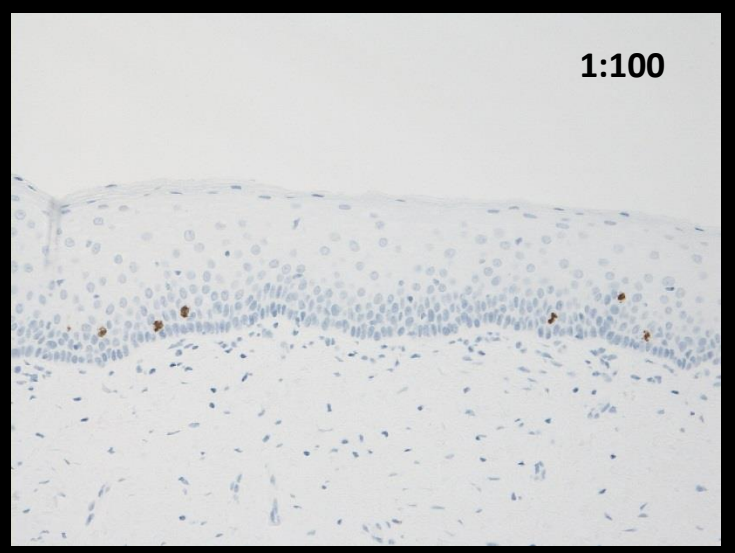


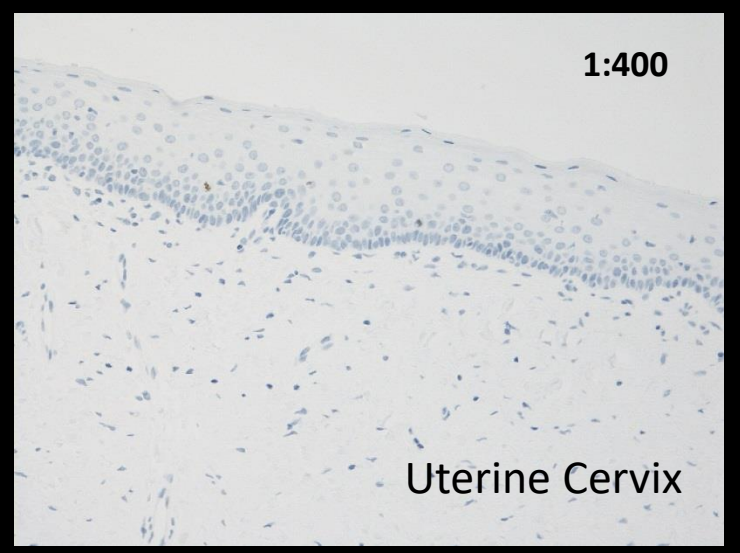




PHH3, BC37 (Biocare)





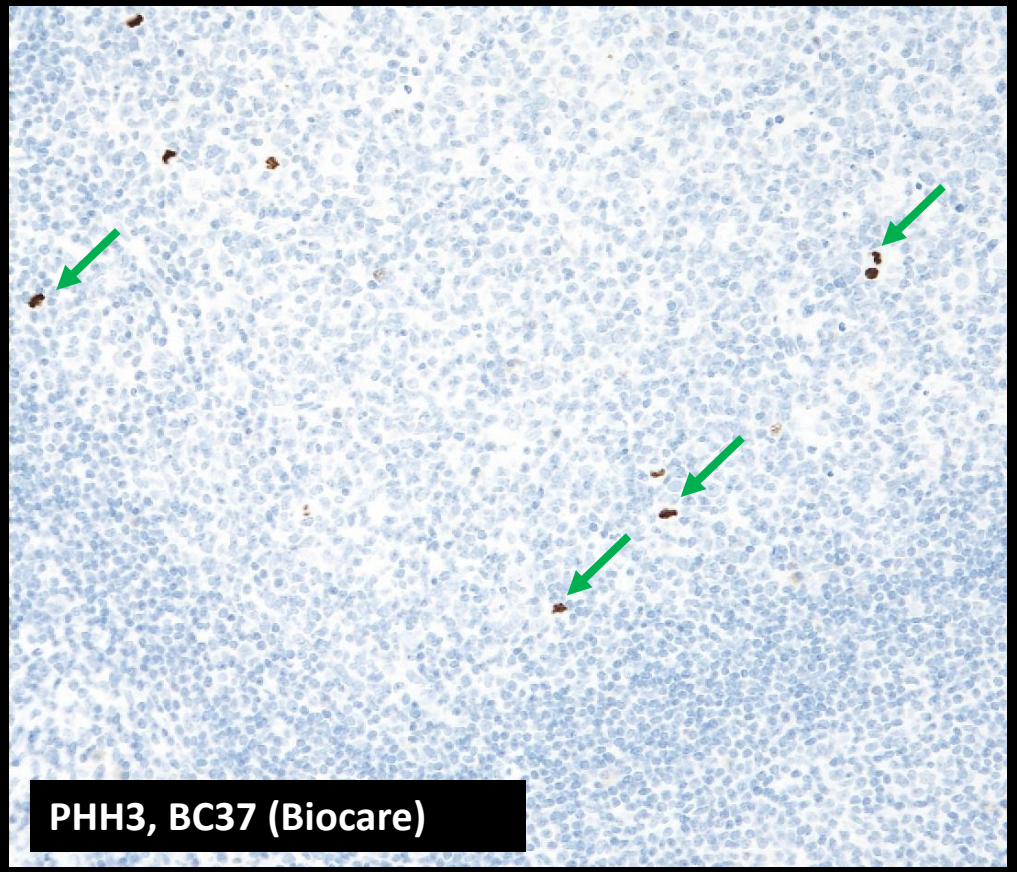


HIER Low pH/Flex+

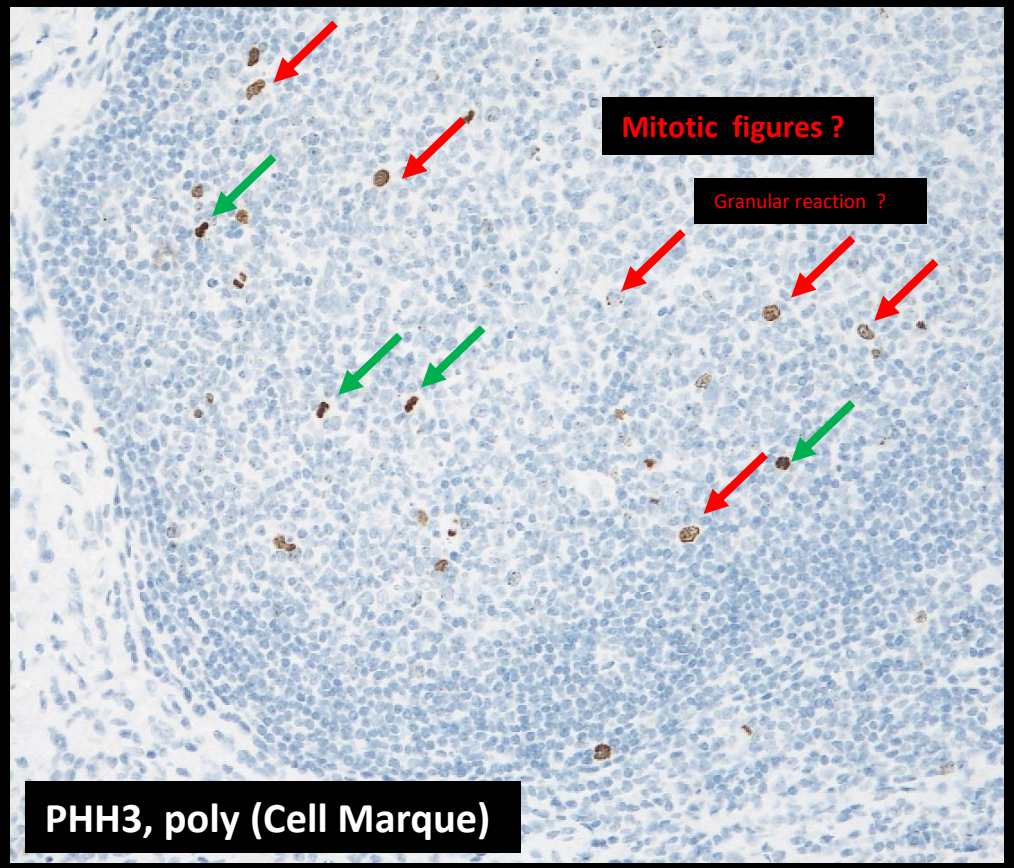
PHH3 should only be positive in cells in the late G2 and M phase (mitotic cells)

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Primary antibody poorly calibrated (false positive)



PHH3, BC37 (Biocare)



PHH3, poly (Cell Marque)

PHH3, poly might not be completely phospho-specific and might cross-reacts with cells that has not entered th late G2/M phase

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg [1,2] · Søren Nielsen [1]

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

37% insuff.

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

Problems related to:

- ❑ The choice and use of the primary antibody (Concentrate or RTU)
  - Inappropriate primary antibody
    - Provide low sensitivity/specificity
  - Appropriate primary antibody
    - Inapp. titre (too low or too high concentration)
  - Platform (stainer) dependent antibodies
    - Provide low sensitivity / specificity

False positive or false negative results

BRAFmut	VE1	In general challenging on most platforms except for the Benchmark Ultra (Ventana)
CR	DAK-Calret1	Benchmark and Omnis
Desmin	D33	Omnis
Use of RTU-formats "Off-label"	E.g., Myosin, smooth muscle heavy chain	Often seen on the Omnis (RTU portfolio: IR vs GA products ?)

Chromogranin A ?

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Problem: Use of RTU-formats "Off-Label" exemplified by Myosin, smooth muscle heavy chain (SMH) NQC assessment Run 66

Autostainer (SMH, product IR066):

VRPS: Pass rate of 73% (18% optimal)

LMPS: Pass rate of 86% (57% optimal)

Omnis (SMH, Product IR066, Off-Label use)

Pass rate of 15% (no optimal results)

All the insufficient results were commented as weak, false negative or poor-signal-to-noise-ratio characterized by extensive background reaction combined with **difficulties to demonstrate low-level antigen expressing structures.** In this context, it was more successful to use the concentrated format of mAb clone SMMS-1 on Dako Omnis (see Table 2) as alternative to the off-label use of a **RTU format not being developed and validated for the respective IHC platform.**

Dako RTU IR-products providing poor results on the Omnis (2022-2023):
Desmin, D33/IR606 (Run 64, 2022)
Calretinin, DAK-Calret1/IR627 (Run 64, 2022)
CD56, 123C3/IR628 (Run 64, 2022)
CD4, 4B12/IR649 (Run 67, 2023)

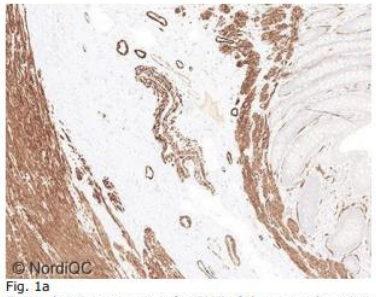

Fig. 1a
Optimal staining reaction for SMH of the appendix using the mAb clone SMMS-1 RTU (Ventana/Roche, 760-2704) within laboratory modified protocol settings, using OptiView as detection system.
Virtually all smooth muscle cells in vessels and lamina muscularis show a moderate to strong cytoplasmic staining reaction.
Also compare with Figs. 2a – 5a, same protocol.

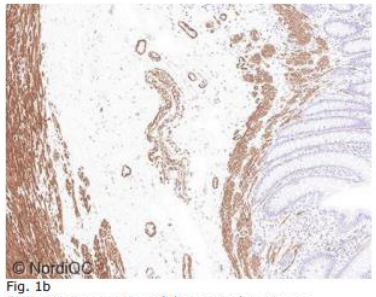

Fig. 1b
SMH staining reaction of the appendix using an insufficient protocol based on the mAb clone SMMS-1 RTU (Dako/Agilent, IR066) developed for the Autostainer, but applied on the Dako Omnis platform.
In appendix – same field as Fig. 1a, a weak to strong staining reaction is seen in virtually all smooth muscle cells as expected.
Also compare with Figs. 2b – 5b, same protocol.

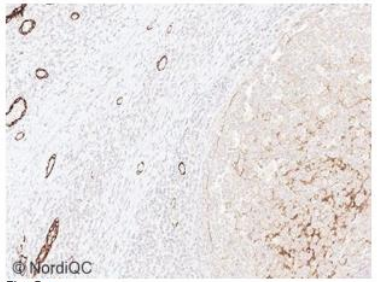

Fig. 2a
Optimal SMH staining reaction of the tonsil using same protocol as in Fig. 1a.
A weak to moderate staining reaction is seen in the follicular dendritic network in the germinal center.
A high signal-to-noise ratio is observed.

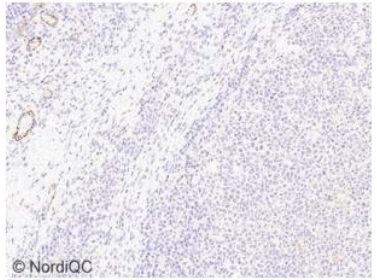

Fig. 2b
Insufficient SMH staining reaction of the tonsil using same protocol as in Fig. 1b - same field as Fig. 2a.
The follicular dendritic network in the germinal center is virtually negative and only the smooth muscle cells of large vessels are demonstrated.

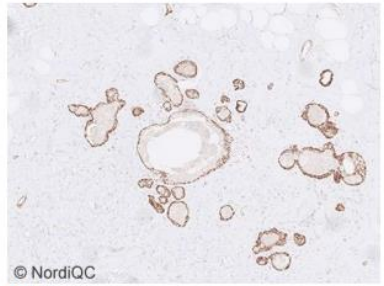

Fig. 3a
Optimal SMH staining reaction of the breast hyperplasia using same protocol as in Figs. 1a and 2a.
A moderate and distinct staining reaction is seen in virtually all myoepithelial cells lining the breast glands.

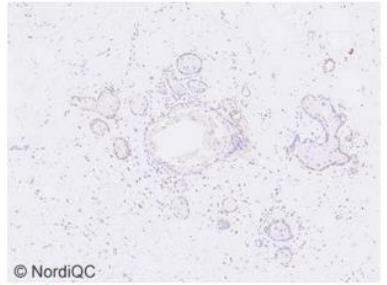

Fig. 3b
Insufficient SMH staining reaction of the breast hyperplasia using same protocol as in Figs. 1b and 2b – same field as Fig. 3a.
Only a faint staining reaction is seen in few myoepithelial cells lining the breast glands.

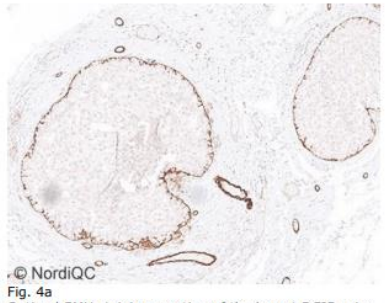

Fig. 4a
Optimal SMH staining reaction of the breast DCIS using same protocol as in Figs. 1a - 3a.
A moderate, distinct and continuous staining reaction is seen in the myoepithelial cells lining the breast DCIS component.

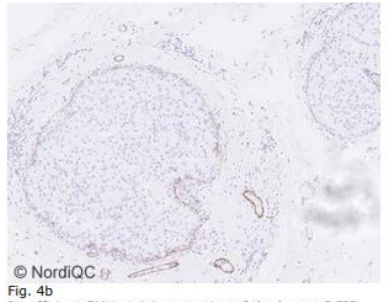

Fig. 4b
Insufficient SMH staining reaction of the breast DCIS using same protocol as in Figs. 1b – 3b – same field as Fig. 4a.
Only a weak and disrupted staining reaction is seen in the myoepithelial cells lining the breast DCIS component.

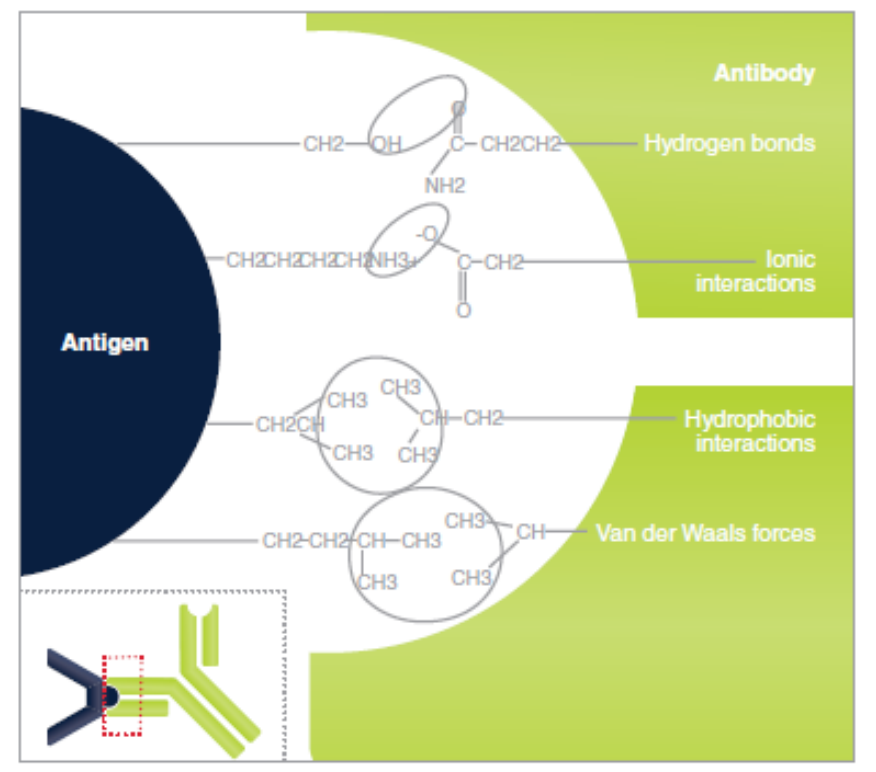
Changing the primary Ab

Changing Ab-Ag reaction microenvironment (Diluent)

Low affinity primary antibodies

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Antibody Diluents: Antigen-Antibody reactions



The strength by which the primary Ab binding site binds to an antigenic epitope is called affinity

Antibodies are attracted initially through electrostatic interactions, and subsequently through weak forces

- Hydrogen bonds
- Hydrophobic interactions
- Van der Waals forces

Antibody diluent formulations can significantly alter stability and binding properties of antibodies affecting both epitope specificity and non-specific interactions

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Applied Immunohistochemistry & Molecular Morphology 9(2): 176–179, 2001

Formalin-Fixed and Heat-Retrieved Tissue Antigens: A Comparison of Their Immunoreactivity in Experimental Antibody Diluents

Thomas Boenisch, M.S.

Antibody diluents

Demonstrated that:

pH of the antibody diluent had a high impact of the final IHC result

Addition of NaCL (increasing the ionic strength) to the diluent negates most of the sensitivity gained through Antigen Retrieval (Table 3).

TABLE 3. *Comparison of staining scores of 13 optimally diluted antibodies as a function of antigen retrieval at pH 9.9, use of 0.05 M Tris (TB), pH 6.0 and 8.6, or Tris-buffered 0.15 M NaCl (TBS) of pH 6.0 and 8.6, and 0.02 M phosphate-buffered 0.15 M NaCl of pH 7.5 (PBS)*

Ductal breast carcinoma (A and B) and urothelial carcinoma (C and D) stained for GATA3 (clone L50-823) in two laboratories. Optimal results in A and C, insufficient in D. The only difference in protocols is the antibody dilution buffer: In A and C the antibody was diluted in Biocare Renoir red (ph 6.2). In B and D the Dako antibody diluent pH 7.3 was used.

Antibody diluents (Experience from Dept. of surgical Pathology, Region Zealand, Denmark on the Omnis)

Antibodies benefitting from dilution in Renoir Red pH 6.2 (improving signal):

ALK (1A4), CR (CAL6), CD4 (EP204), CD5 (SP19), CMYC (EP121), GATA3 (L20-823), GPC3 (1G12), IMP3 (69.1), MLH1 (BC23, ES05 & GM011), MSH2 (G219-1129), MSH2 (FE11), MSH6 (EP49), NKX 3.1 (poly), SALL4 (6E3), PAX8 (ZR1), PMS2 (EP51), SOX10 (EP268), SOX11 (C1 & MRQ58), TdT (SEN28 & EP266), UP-II (BC21), WT1 (WT49) and …….

Antibodies not benefitting from dilution in Renoir Red pH 6.2 (compared to Dako diluent pH 7.3):

BCL2 (124), BCL6 (LN22 & PG-B6p & GI191E/A3), CR (DAK-Calret1), CD10 (56C6), CD163 (MRQ26), CD21 (2G9), CD5 (4C7), ER (SP1), HHV8 (13B10), Mammaglobin (304-1A5), MUC5AC (CLH2), MUC6 (CLH5), and …….

Antibodies benefitting from dilution in Background sniper (reduces background problems):

Spirochete (poly), BORR (poly), WT1 (EP122) and …….

ANNUAL REVIEW ISSUE

Proficiency testing in immunohistochemistry—experiences from Nordic Immunohistochemical Quality Control (NordiQC)

Mogens Vyberg[1,2] · Søren Nielsen[1]

Problems related to the choice of the detection system:

- **Provides low sensitivity**
  - 2 versus 3(4)-step multimer/polymer detection systems
- **Provides low specificity and sensitivity**
  - Biotin based systems

False positive or false negative results

Table 3 Major causes of insufficient staining reactions

1. Less successful antibodies (17 %)
   a. Poor antibodies[a]
   b. Less robust antibodies[b]
   c. Poorly calibrated RTUs
   d. Stainer platform dependent antibodies
2. Insufficiently calibrated antibody dilutions (20 %)
3. Insufficient or erroneous epitope retrieval (27 %)
4. Error-prone or less sensitive visualization systems[c] (19 %)
5 Other (17 %)
   a. Heat-induced impaired morphology
   b. Proteolysis induced impaired morphology
   c. Drying out phenomena
   d. Stainer platform-dependant protocol issues
   e. Excessive counterstaining impairing interpretation

19% insuff.

[a] Consistently gives false negative or false positive staining or a poor signal-to-noise ratio in one or more assessment runs

[b] Frequently giving inferior staining results, e.g., due to mouse-anti-Golgi reactions or sensitive to standard operations as blocking of endogenous peroxidase

[c] Biotin-based detection kit for cytoplasmic epitopes, use of detection kits providing a too low sensitivity, or use of detection kits and chromogens giving imprecise localization of the staining signals complicating the interpretation

NQC Run 66, 2022: Synaptophysin clone DAK-Synap

Detection system

Omnis (same pattern was seen on the Autostainer)

In this assessment, the RTU system GA660 based on mAb clone DAK-SYNAP (Dako/Agilent) applied by the vendor recommended protocol settings was the most successful assay for the demonstration of SYP providing a pass rate of 100% (34 of 34), 85% (29 of 34) being optimal. The vendor recommended protocol was based on HIER using TRS high for 30 min., Ab incubation for 25 min. and the FLEX+ protocol (GV800/GV823+GV821). 13 laboratories modified the protocol by removing the linker, all provided an insufficient result. 2 participants used the RTU format off-label on a non-intended IHC platform.

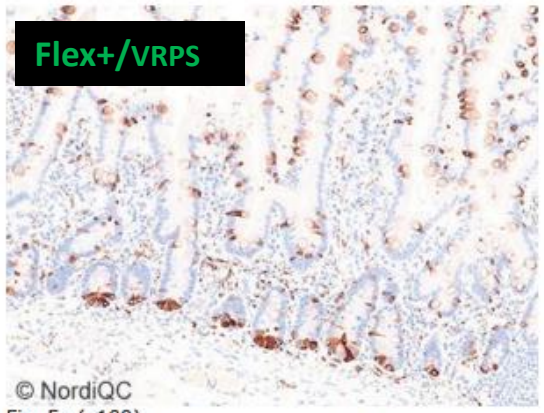

Fig. 5a (x100)
Optimal staining reaction for SYP in the duodenum using the mAb clone DAK-SYNAP (RTU GA660, Dako/Agilent), with vendor recommended protocol settings. The Paneth cells in the bottom of the crypt of Lieberkühn display a strong staining reaction. The goblet cells both in the mucin contained in the cytoplasm and in the cell membrane surrounding the mucin display a moderate to strong staining reaction without any staining of the other epithelia cells. Same protocol used in Fig. 6a.

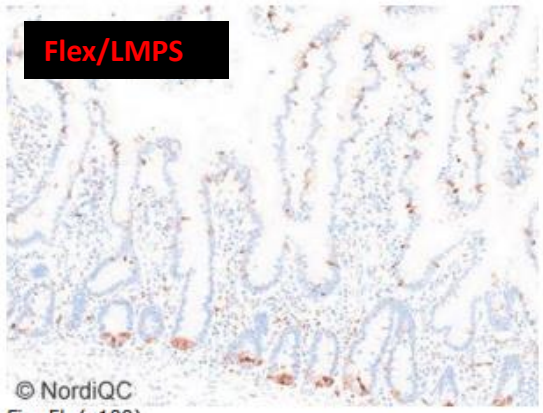

Fig. 5b (x100)
Insufficient staining reaction for SYP in the duodenum using the mAb clone DAK-SYNAP (RTU GA660, Dako/Agilent), with the same settings as in Fig. 5a but without linker. The Paneth cells in the bottom of the crypt of Lieberkühn display a weak to moderate staining reaction and only few goblet cells in the bottom of the crypts are weakly stained.
Same protocol used in Fig. 6b – same field as 1a- 1b and 5a.

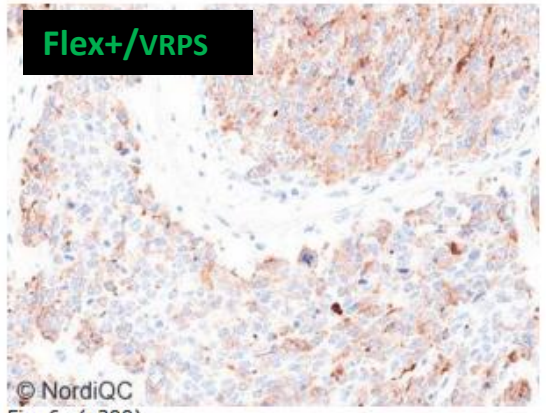

Fig. 6a (x200)
Optimal staining reaction of SYP in the SCLC using same protocol as in Fig. 5a. All majority of the neoplastic cells show a weak to strong cytoplasmic staining reaction.

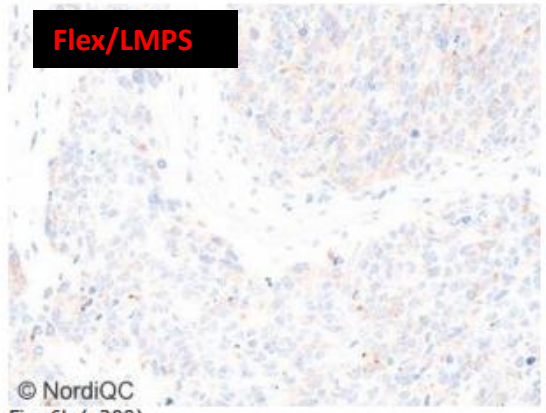

Fig. 6b (x200)
Insufficient staining reaction of SYP in the SCLC using same protocol as in Fig. 5b – same field as Figs. 2a- 2b and 6a. The neoplastic cells display a too weak staining intensity with large parts of the tumor completely negative.

Bond™ Polymer Refine Detection
Catalog No: DS9800

Intended Use

This detection system is for *in vitro* diagnostic use.

Bond Polymer Refine Detection is a biotin-free, polymeric horseradish peroxidase (HRP)-linker antibody conjugate system for the detection of tissue-bound mouse and rabbit IgG and some mouse IgM primary antibodies. It is intended for staining sections of formalin-fixed, paraffin-embedded tissue on the Bond™ automated system.

The clinical interpretation of any staining or its absence should be complemented by morphological studies and proper controls. They should be evaluated within the context of the patient's clinical history and other diagnostic tests by a qualified pathologist.

The Bond Polymer Refine Detection Kit must be used with laboratory best practice in the use of tissue controls. For assurance, laboratories should stain each patient sample in conjunction with positive, negative, and other tissue specific controls as needed.

Summary and Explanation

Immunohistochemical techniques can be used to demonstrate the presence of antigens in tissue and cells (see "Using Bond Reagents" in your Bond user documentation).

Bond Polymer Refine Detection utilizes a novel controlled polymerization technology to prepare polymeric HRP-linker antibody conjugates. The detection system avoids the use of streptavidin and biotin, and therefore eliminates non-specific staining as a result of endogenous biotin.

Bond Polymer Refine Detection works as follows:

- The specimen is incubated with hydrogen peroxide to quench endogenous peroxidase activity.
- A user-supplied specific primary antibody is applied.
- Post Primary IgG linker reagent localizes mouse antibodies.
- Poly-HRP IgG reagent localizes rabbit antibodies.
- The substrate chromogen, 3,3'-Diaminobenzidine tetrahydrochloride hydrate (DAB), visualizes the complex via a brown precipitate.
- Hematoxylin (blue) counterstaining allows the visualization of cell nuclei.

Using Bond Polymer Refine Detection in combination with the Bond automated system reduces the possibility of human error and inherent variability resulting from individual reagent dilution, manual pipetting and reagent application.

The detection system Bond Refine acts by nature as a 2-step polymer system for detection of rabbit polyclonal or rabbit monoclonal primary antibodies

Only enhances reactions with mouse primary antibodies due to the Post Primary IgG linker (Rabbit antibody)

Tyramide Signal Amplification

Mechanism of Tyramide amplification:

- Introducing HRP (Optiview)
- Incubation with HQ-labelled Tyramide + H2O2

Tyramide, a phenolic compound, is converted into an short-lived extremely reactive intermediate

- Deposit HQ molecules in close vicinity of Ab/Ag reactions

Intermediates covalently binds rapidly to electron rich regions of adjacent proteins (esp. tyrosine)

- Detection of HQ with anti-HQ / HRP Multimer
- Visualization with DAB

Concentration dependent and adverse effects in immunohistochemistry using the tyramine amplification technique

Michael Mengel[1], Martin Werner[2] & Reinhard von Wasielewski[1,*]
[1]*Institut für Pathologie der Medizinischen Hochschule Hannover, Carl Neuberg-Str. 1, D-30625 Hannover, Germany*
[2]*Institut für Pathologie der Technischen Universität München, Germany*
**Author for correspondence*

Received 8 September 1998 and in revised form 1 December 1998

Summary

Although the tyramine amplification technique to enhance sensitivity in immunohistochemistry has been described in numerous methodological papers, it has not yet gained access to diagnostic immunohistochemistry. This is mainly due to problems and pitfalls occurring in adaptation of this method to routine application.

In this study a monoclonal antibody and a polyclonal antiserum (pan-cytokeratin and anti-myoglobin) were tested in tissues with different amounts of epitopes, using a checkerboard table and testing a total of 133 different dilution combinations of both the tyramide solution and the primary antibodies.

The specific tissue investigated, i.e. the amount of accessable epitope to be detected and the applied concentration of the tyramide solution mainly influenced the staining reaction. Several pitfalls such as an uneven distribution of the staining or dramatic overstaining (paradoxical overstaining) must be considered to achieve optimal results.

In conclusion, our data confirm methodological studies that the tyramine amplification technique is a powerful method to enhance immunohistochemical sensitivity. However, for reliable daily practice several pitfalls of the technique have to be circumvented.

TSA enhancement

Difficult to control causing:

- False positive staining

- Weak or false negative staining, unbalanced reaction of primary Ab and target epitopes giving a yes or no answer

- Uneven distribution of the TSA reaction product

NQC Run 66 (Napsin A)

Problem with TSA Amp and false positive reactions (SCC of the lung)

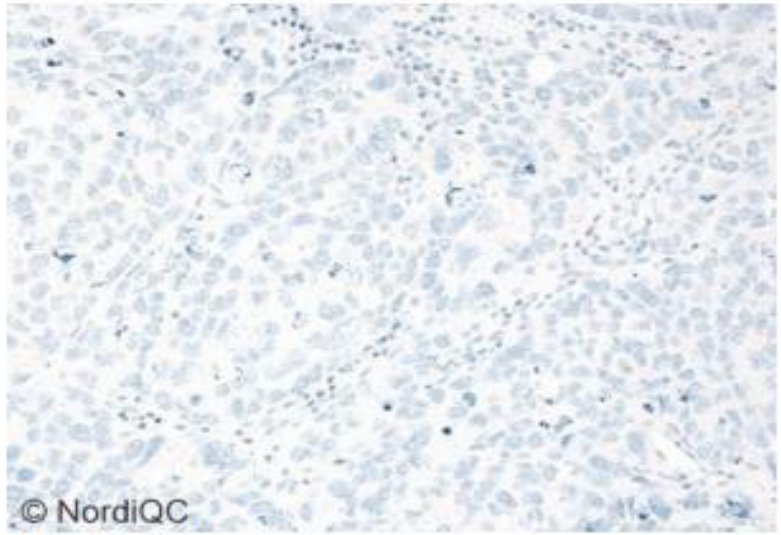

Fig. 5a (x200)
Optimal staining reaction for Napsin A of the lung squamous cell carcinoma using the RTU system 760-4867 (Benchmark Ultra, Ventana/Roche) based on the mAb clone MRQ-60. Vendor recommended protocol settings were applied and OptiView was used as the detection system. All (8/8) protocols based on the same conditions, gave an optimal result. The protocol also provided the same reaction patterns as illustrated in Fig 1a-3a. and as expected, a negative result in the neoplastic cells of the lung squamous cell carcinoma.

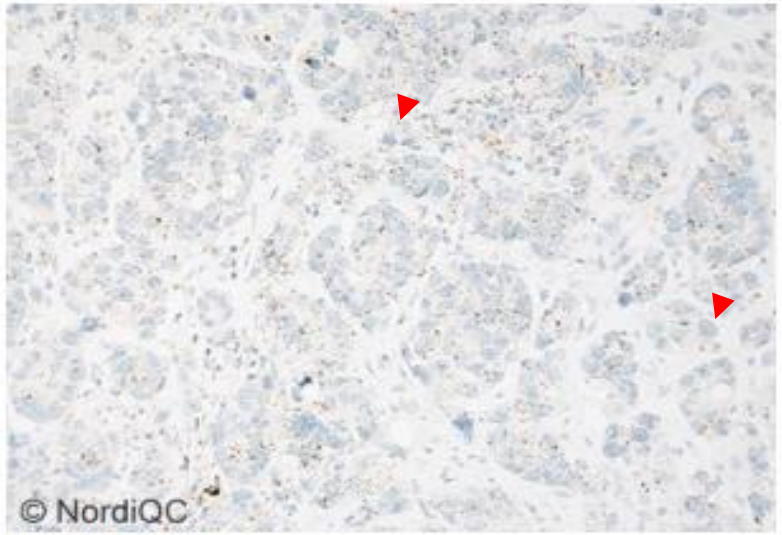

Fig. 5b (x200)
Insufficient staining reaction for Napsin A of the lung squamous cell carcinoma using the same RTU product as in Fig. 5a, but with extended HIER time in CC1 (64 min. at 98°C) extended incubation time in primary Ab (32 min.) and OptiView with amplification as detection system. The neoplastic cells display a false positive and granular staining reaction. This problem was often seen with tyramide signal amplification. Laboratories should be cautious using this amplification step due to the granular deposit of the reaction product, that erroneously can be interpreted as a specific signal for Napsin A - compare with Fig 5a.

Adenocarcinoma of the lung)

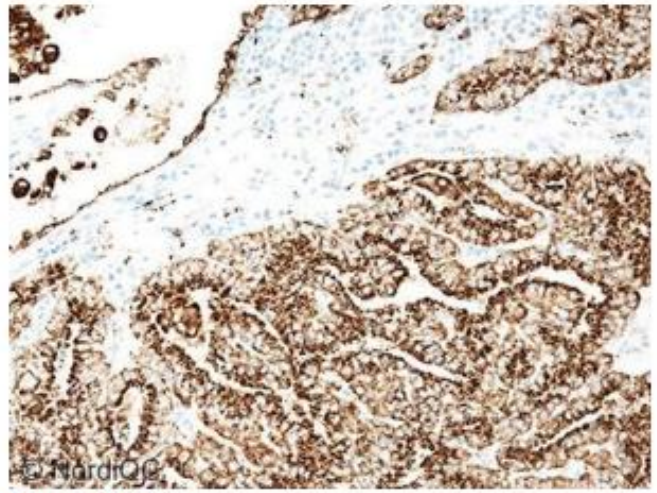

Fig. 3a (x200)
Optimal staining reaction for Napsin A staining of the lung adenocarcinoma (tissue core 3) using same protocol as in Figs. 1a and 2a. All the neoplastic cells display a strong and distinct granular cytoplasmic staining reaction.

TSA: Granular specific reactions vs granular unspecific reactions ?

OptiView + TSA

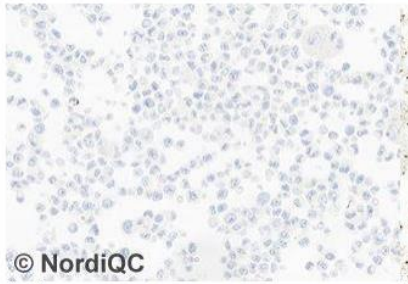

Fig. 6a
Optimal ALK staining of the cell line without ALK rearrangement using same protocol as in Figs. 1a – 5a. All cells are unstained.

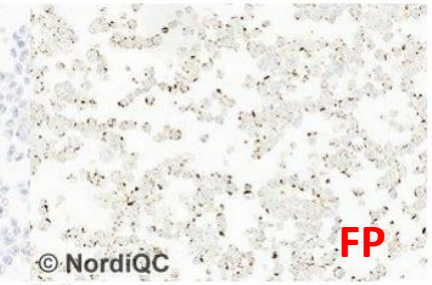

Fig. 6b
Aberrant ALK staining of the cell line without ALK rearrangement using the Ventana Ready-To-Use system based on the rmAb clone D5F3, prod. No. 790-4794. The vast majority of cells show an intracytoplasmic dot-like staining reaction.
This aberrant result was seen in a high number of protocols based on this system (31 of 51). As the system otherwise provided the results expected in all the histological specimens tested, the unexpected result in the cell line was not encountered in the final assessment score.
The positive staining reaction most likely was due to the tyramide based amplification step interacting with an unknown sequence in the cell lines. As such negative reagent controls omitting the primary antibody revealed same reaction in both cell lines included.
Also compare with Figs. 7a and 7b using same protocol/system in the two lung adenocarcinomas, where the result expected is obtained.

Lu-ALK

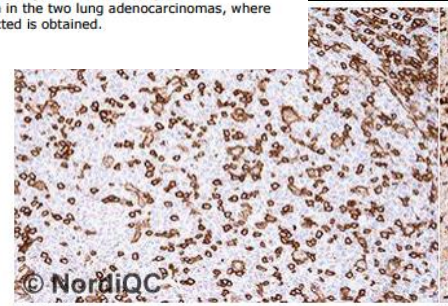

Fig. 1a (x200)
Optimal CD4 staining of the tonsil using the rmAb clone SP35 as a concentrate, HIER in an alkaline buffer (CC1 pH 8.5) and a 3-step multimer based detection system (OptiView, Ventana) - same protocol used in Figs. 2a - 4a. The inducer/helper T-cells show a strong staining reaction, while the germinal centre macrophages show a moderate and distinct membranous staining reaction - compare with Fig.1b.

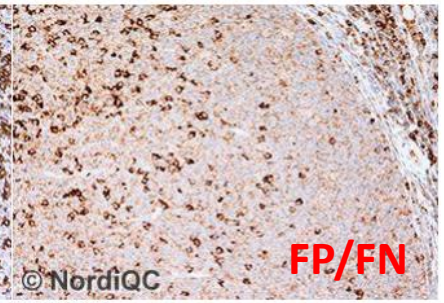

Fig. 1b (x200)
Insufficient CD4 staining of the tonsil using the mAb 4B12 as a concentrate, HIER in an alkaline buffer (CC1 pH 8.5) and a multimer based detection system (OptiView with Tyramide amplification, Ventana) -same protocol used in Figs. 2b-4b. The protocol provided a too low sensitivity, but also poor signal-to-noise ratio and false positive staining. No staining of germinal centre macrophages is seen and simultaneously B-cells are labelled. The pattern of too weak staining reaction was observed with all protocols based on the mAb 4B12 performed on the Ventana BenchMark platform - compare with Fig. 1a (same field).

CD4

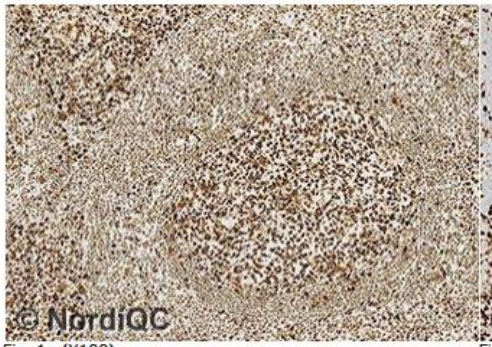

Fig. 1a (X100)
Optimal MSH6 staining reaction of the tonsil using the rmAb clone EP49, optimally calibrated, HIER in an alkaline buffer and a 3-step multimer based detection system (OptiView, Ventana). Virtually all mantle zone B-cells show a moderate and distinct nuclear staining reaction, while the germinal centre B-cells show a strong nuclear staining reaction. Also compare with Figs. 2a - 4a, same protocol.

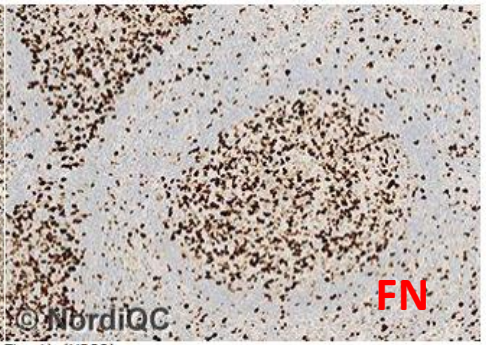

Fig. 1b (X200)
Insufficient MSH6 staining reaction of the tonsil using the rmAb clone EP49 with a protocol providing a too low sensitivity- same field as in Fig. 1a.
Only the germinal centre B-cells are distinctively demonstrated, while mantle zone B-cells expressing low level MSH6 virtually are unstained. The protocol was based on OptiView + amplification (Ventana) and the combination of a too low titre of the primary Ab and the use of tyramide based amplification provided an inadequate balance of the staining reaction.
Also compare with Figs. 2b - 4b, same protocol.

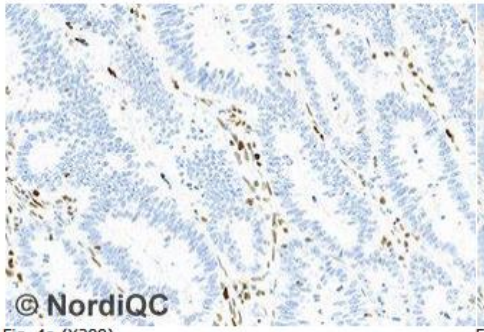

Fig. 4a (X200)
Optimal MSH6 staining reaction of the colon adenocarcinoma no. 4 with loss of MSH6 expression using same protocol as in Figs. 1a - 3a. The neoplastic cells are negative, while stromal cells show a distinct nuclear staining reaction serving as internal positive tissue control.

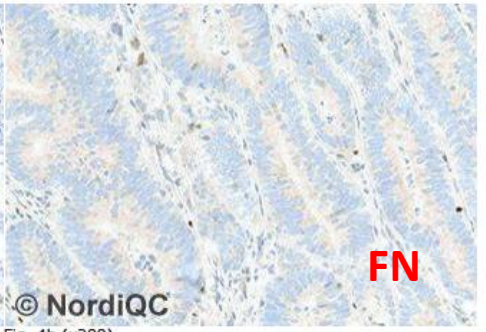

Fig. 4b (x200)
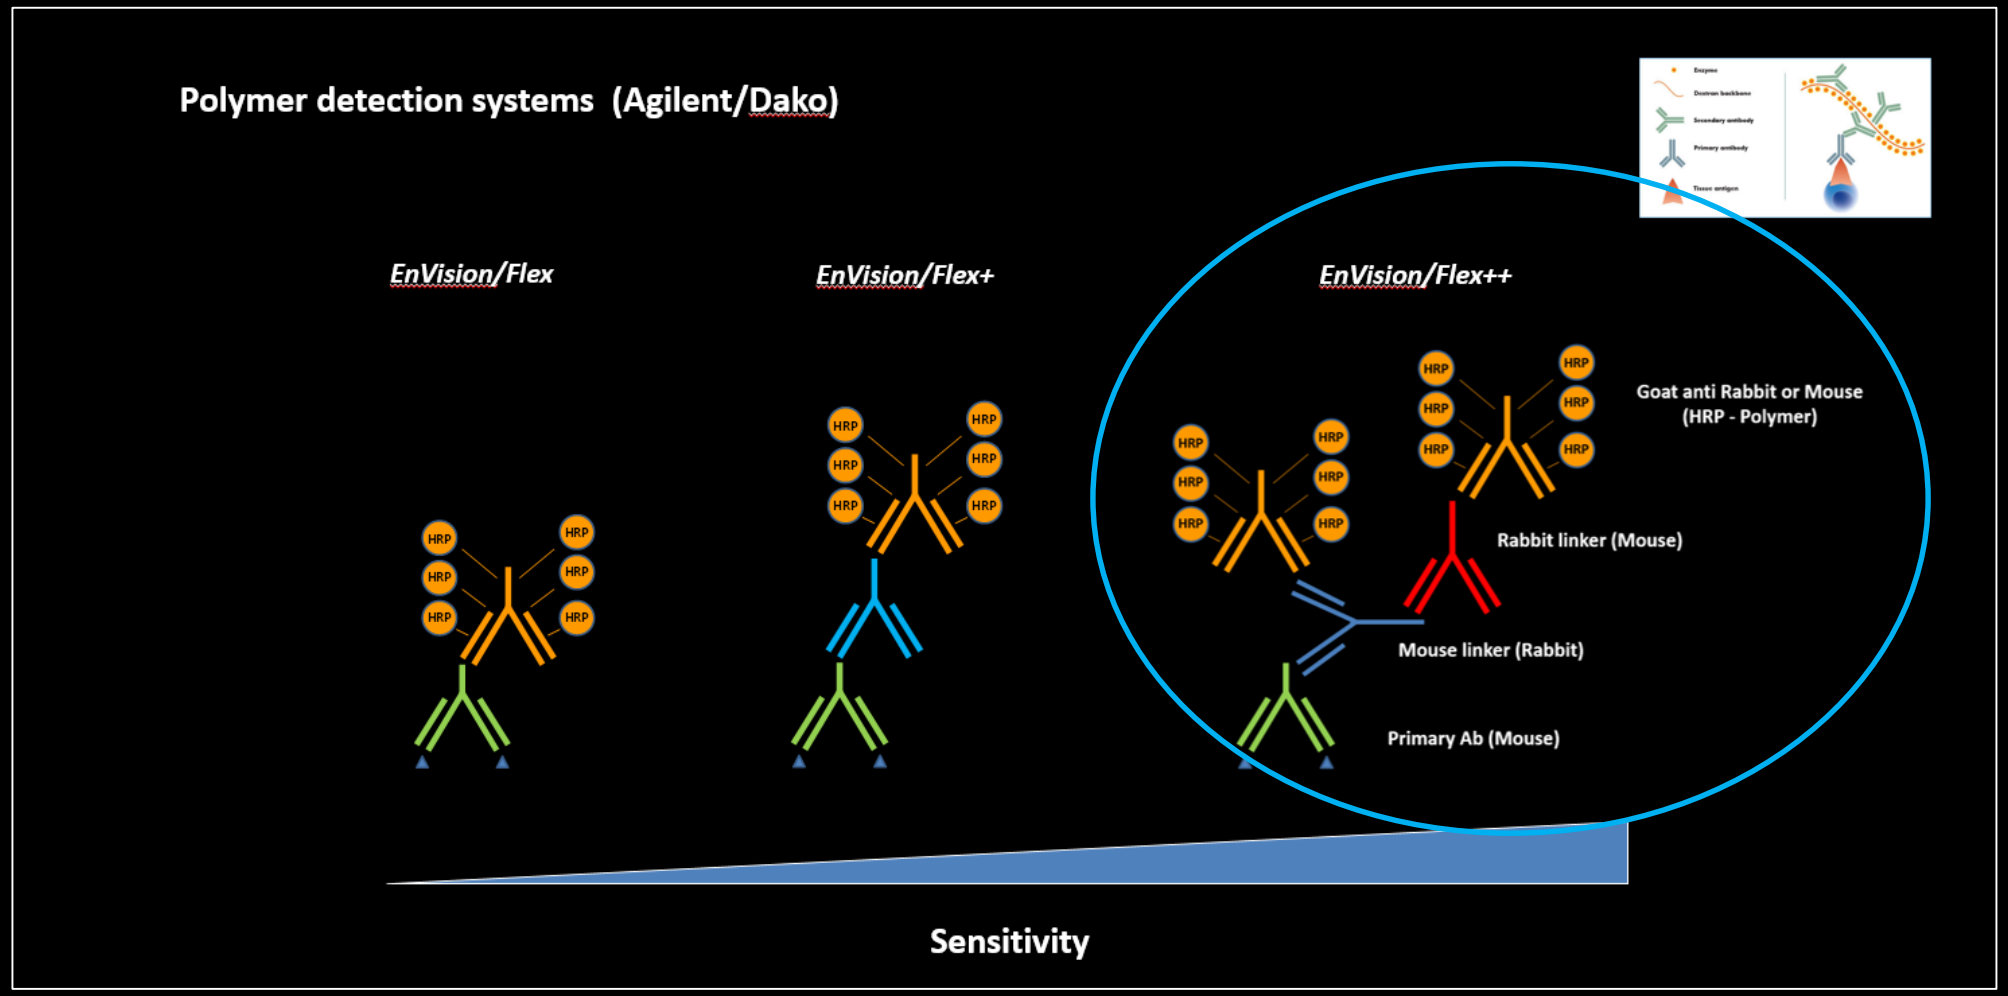
Insufficient MSH6 staining reaction of the colon adenocarcinoma no. 4 with loss of MSH6 expression using same protocol as in Figs. 1b - 3b – same field as in Fig. 4a. No nuclear staining reaction in the neoplastic cells is seen, but as only an equivocal nuclear staining reaction in the normal stromal cells is present, the staining pattern cannot reliably be interpreted. In addition a weak aberrant cytoplasmic staining reaction is seen.

MSH6

The TSA detection system is not without problems and may provided either false positive or negative results.

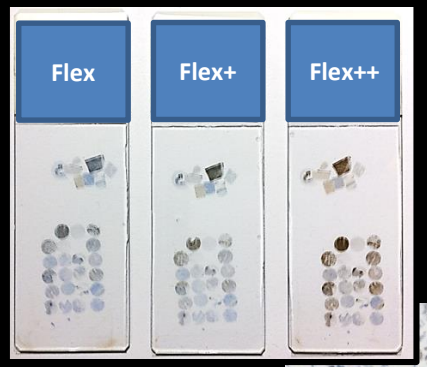
Technical aspects of immunohistochemistry & pitfalls - Analytical phase



“New option” on the Omnis

In general, works well with rabbit primary Abs but less efficient with primary mouse Abs

Omnis: PMS2 clone EP51 (1:300 RR) /High pH 48`



FLEX

FLEX+

FLEX++

Colon tumor

MSI

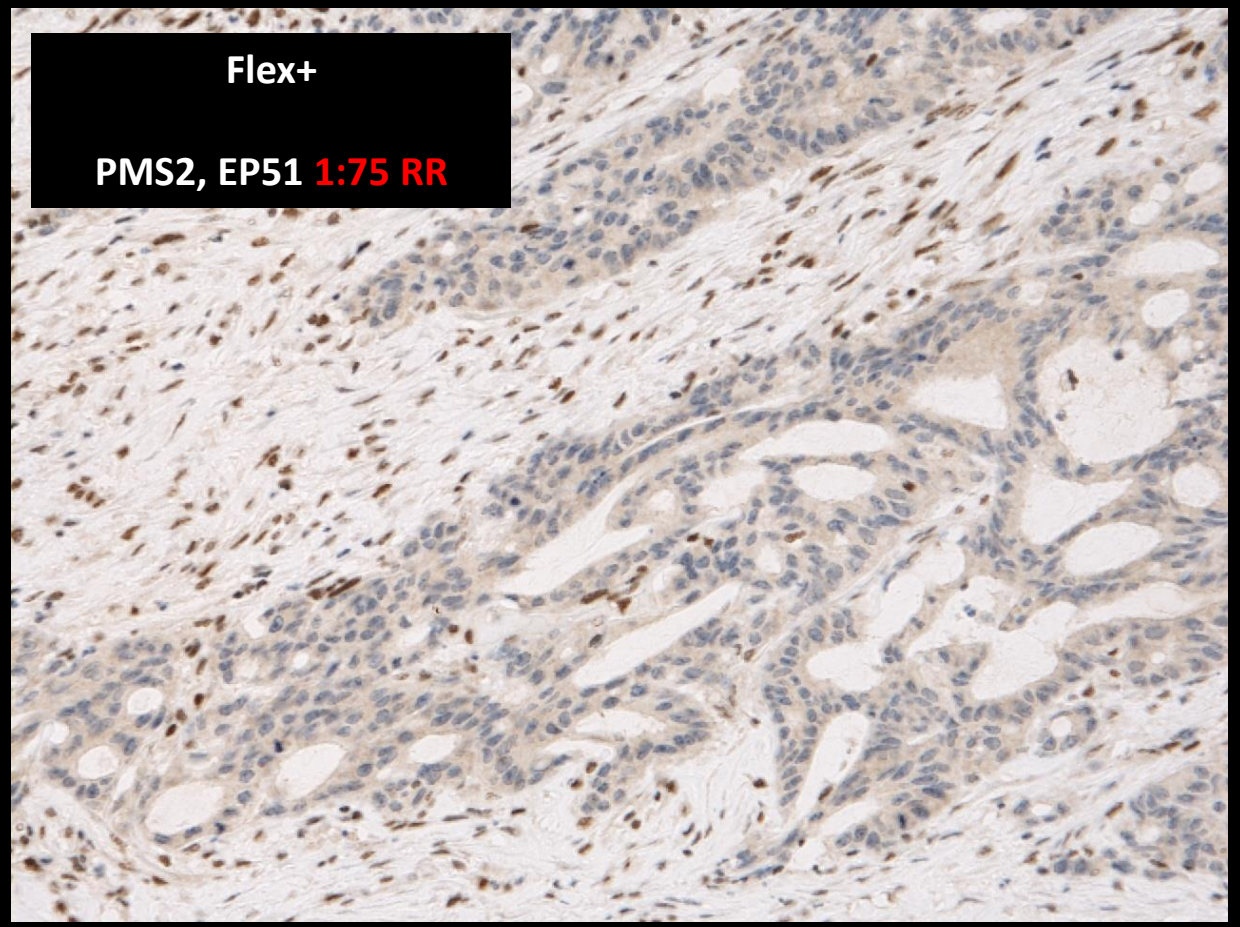
Sensitivity

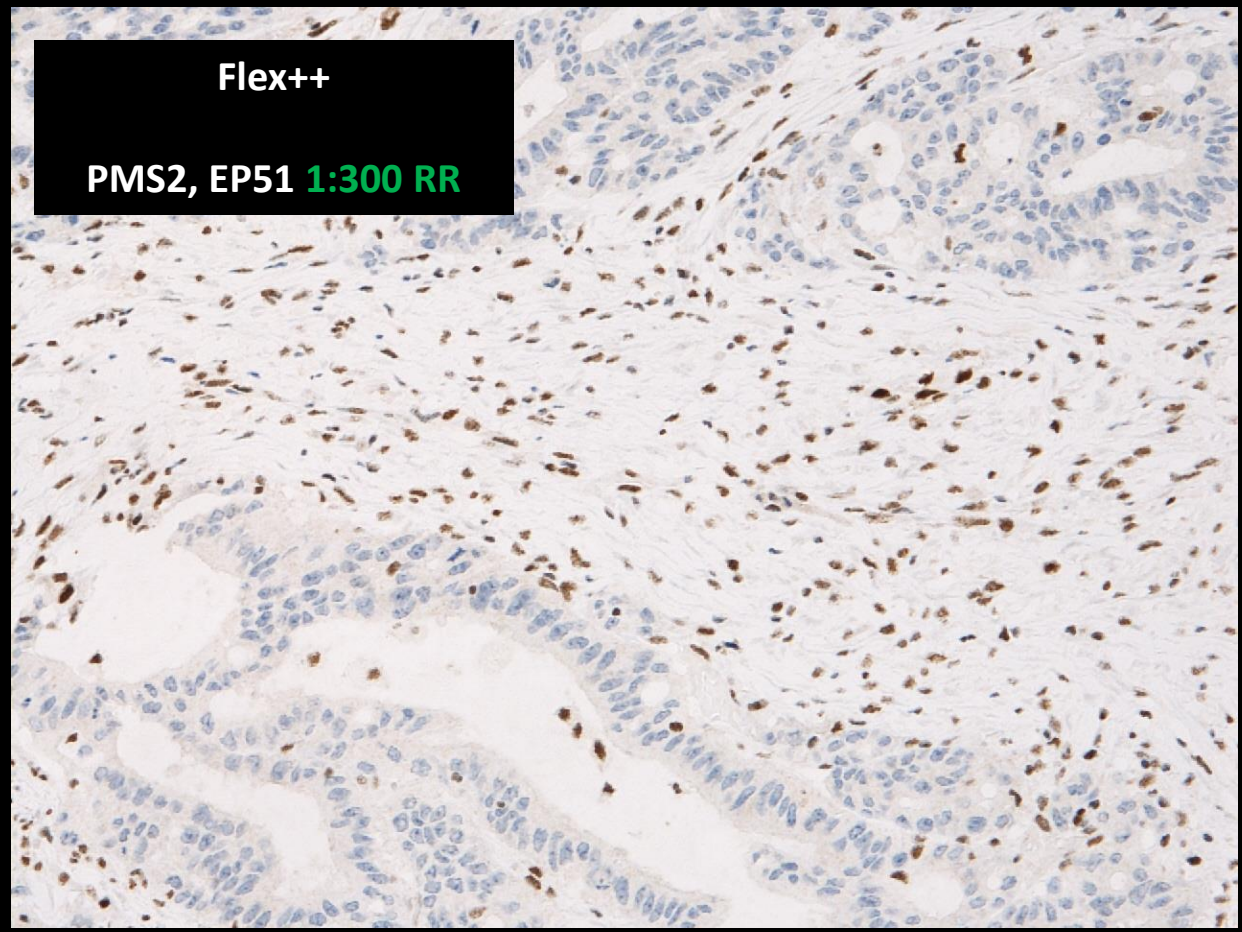
Colon tumor

MSS

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Colon tumor with loss of PMS2: Improves staining quality due to reduced background/noise





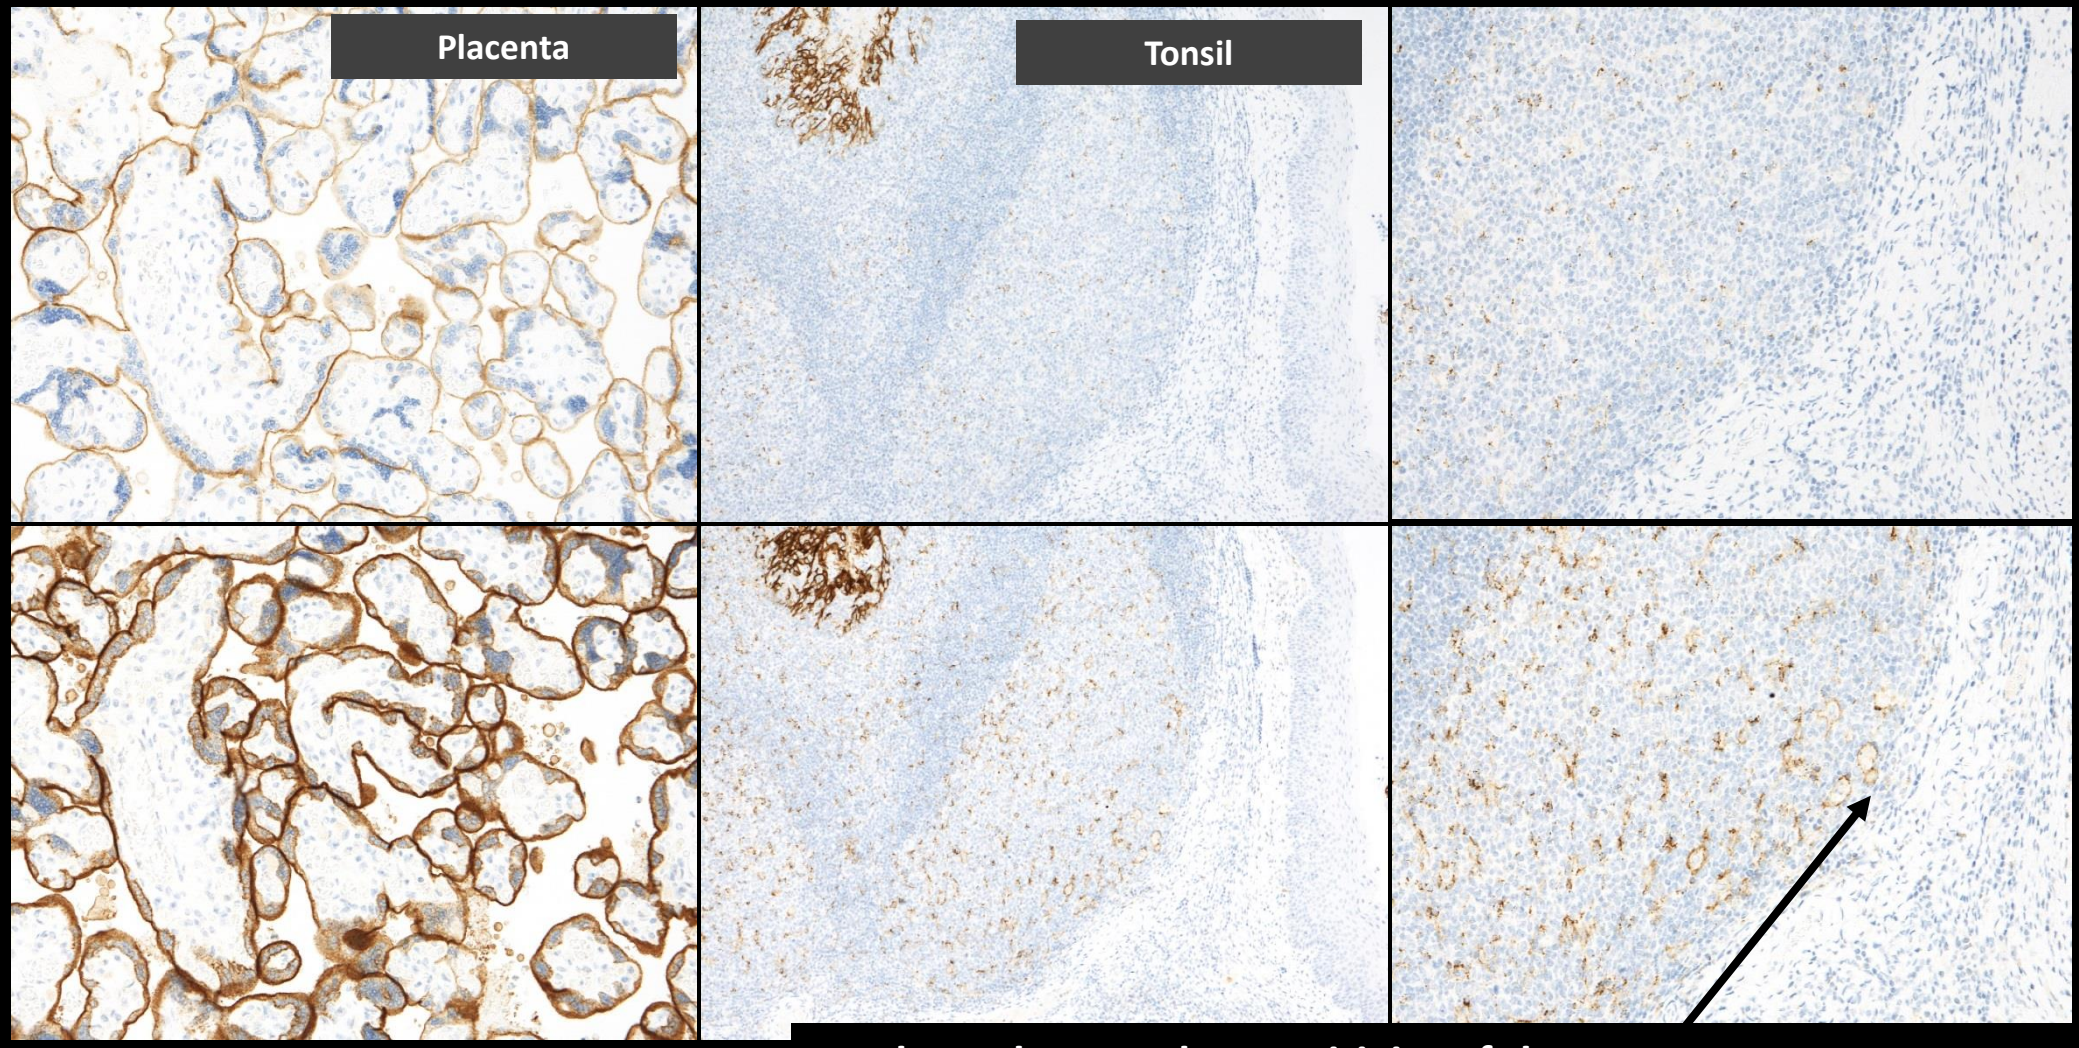
Omnis: HIER High pH 48`

Flex++ : 4-step polymer detection system (30-10-10-20`/Omnis)

rmAb PD-L1, CAL10 (rmAb 1:30RR); HIER in High pH 48`

Flex+

Flex++

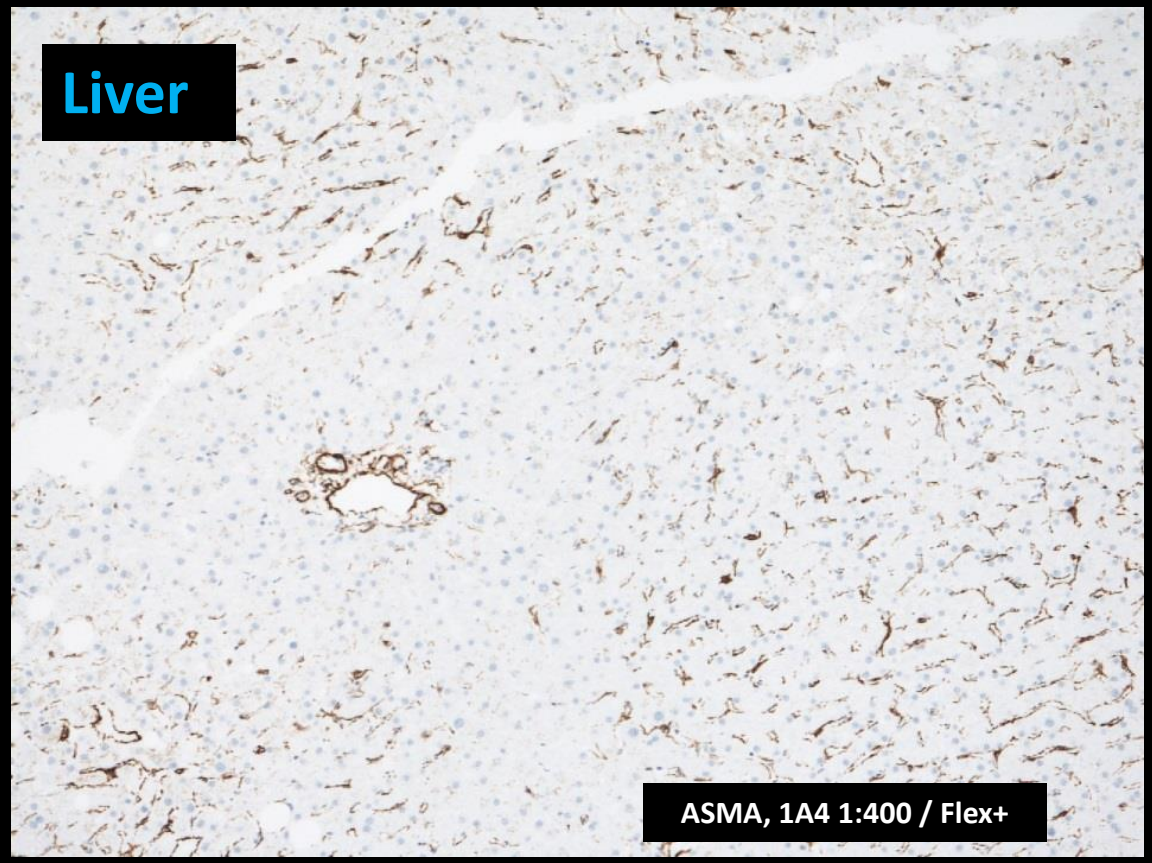


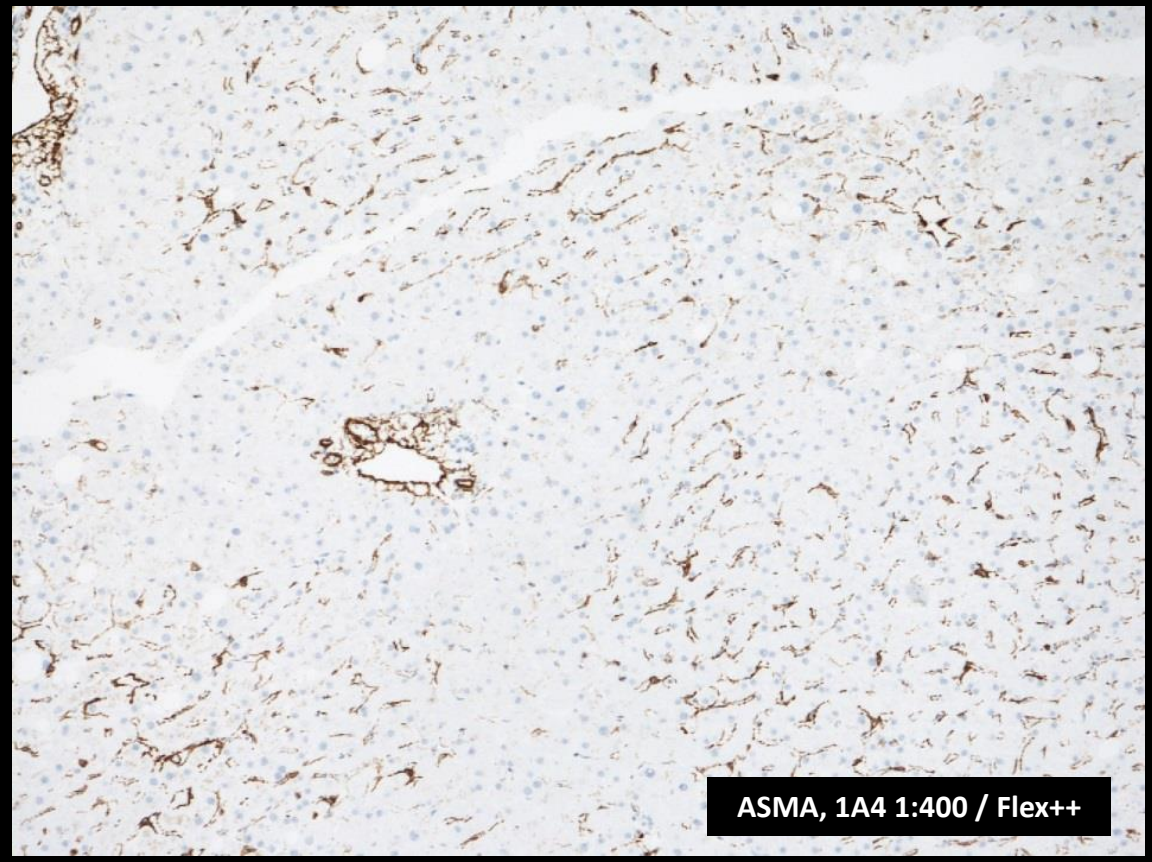
rmAbs: Enhances the sensitivity of the assay

Technical aspects of immunohistochemistry & pitfalls - Analytical phase

Flex++ : 4-step polymer detection system (Omnis)

mAb ASMA clone 1A4; HIER in High pH 24`





Mouse monoclonal antibodies: In most cases, no improvement in signal intensity using Flex++ compared to Flex+

The basal fundament for a technical optimal performance is :

- **Appropriate tissue fixation and processing**
- **Appropriate and efficient epitope retrieval**
  - 95-98% of the Abs require HIER and app. 85-90% prefer high pH (alkaline) retrieval buffers.
  - Use efficient HIER temperature and time (app. 100°C for 20 - 40min).
- **Appropriate choice of antibody / clone, diluent and dilution**
  - Compare different clones / Abs against the selected antigen of interest before implementation
  - Calibrate the Ab concentration carefully
- **Appropriate and specific / sensitive detection system**
  - Use of a 3-step multimer/polymer system is preferable to a 2- step multimer/polymer system
  - Don`t use biotin-based detection systems
- **Appropriate choice of control material**
  - Focus on Immunohistochemistry Critical Assay Performance Controls (iCAPCs)

mAb clone **DC10 GA618**	*CK18*	9	Agilent/Dako	0	2	6	1	-	

The problem:

Abs raised exclusively against CK18 may show partial or complete loss of CK18 in 25% of breast carcinomas depending on their histological type – which was included in the run 57.

NordiQC assessment
CK 8/18

EP17/EP30 = CK8/18

DC10 = CK18 only

Abs raised exclusively against CK18 may show partial or complete loss of CK18 in 25% of breast carcinomas depending on their histological subtype

EP17/EP30 **DC10**

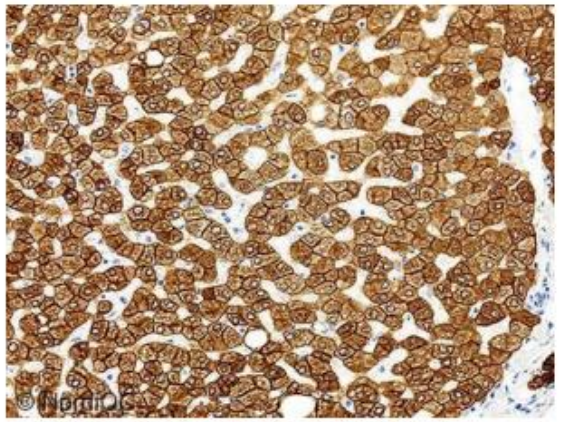

Fig. 3a
Optimal CK8/18 staining of the liver using the rmAb clone cocktail EP17/EP30 as a concentrate in an optimally calibrated LD assay, performed on the Dako Omnis. The vast majority of hepatocytes show a distinct, moderate staining reaction with a membrane enhancement. Compare with Figs. 4a – 6a, same protocol.

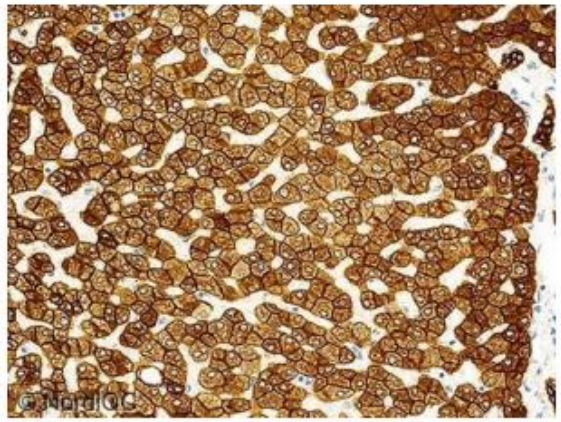

Fig. 3b
Optimal CK8/18 staining of the liver using an insufficient protocol based on the mAb clone DC10. Clone DC10 reacts with CK18 and in this (DC10) CK18-protocol the vast majority of hepatocytes show a distinct, moderate staining reaction with a membrane enhancement. Compare with Figs. 4b – 6b, same protocol. Compare also with Fig. 3a – same field.

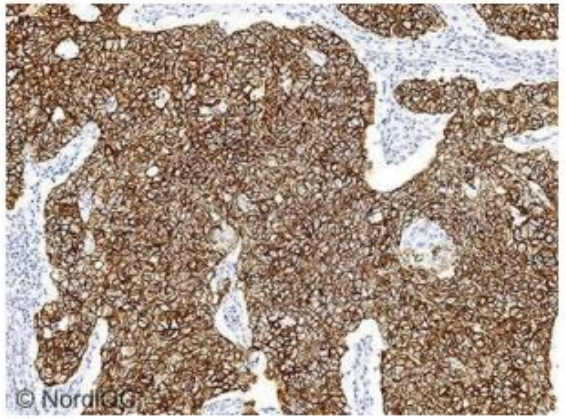

Fig. 5a
Optimal CK8/18 staining of the breast ductal carcinoma using same protocol as in Figs. 3a - 4a. Virtually all neoplastic cells show a strong and distinct cytoplasmic staining reaction. The use of a cocktail of CK8 and CK18 antibodies secures optimal staining reaction despite the apparent loss of CK18 in the tumour. Compare with Fig. 5b – same field.

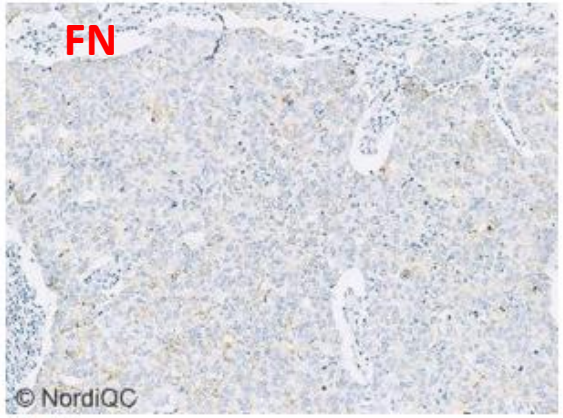

Fig. 5b
Insufficient CK8/18 staining of the breast ductal carcinoma using same protocol as in Figs. 3b – 4b. Despite producing optimal staining in liver (and the SCLC), virtually all neoplastic cells are unstained. This tumour belongs to the approx. 25% of breast carcinomas that shows partial or complete loss of CK18 expression, making CK18 antibodies like clone DC10 less suitable identifying non-squamous carcinomas including adenocarcinoma of unknown origin. Compare with Fig. 5a – same field.

RESEARCH ARTICLE

Performance of 4 Immunohistochemical Phosphohistone H3 Antibodies for Marking Mitotic Figures in Breast Cancer

Cornelia M. Focke, MD,† Kai Finsterbusch, MSc,* Thomas Decker, MD,* and Paul J. van Diest, MD, PhD†*

Conclusions: Performance and reliability varied significantly between the 4 tested antibodies. For faster identification of mitotic hot spots and as potential marker in digital image analysis, the Merck antibodies seem to be most suitable.

Key Words: PHH3, breast cancer, proliferation, mitotic activity, phosphohistone H3
