IHC and Molecular Morphology in the Era of Precision Medicine 8.30am Jan 5, 2018

40 min.

Clive R Taylor MD. Dphil.
MRCP(Ir) , MRCPath (UK).

Precision Medicine requires Precision Diagnostics.

Many of the targets for personalized therapy are proteins

IHC is, in theory, an ideal method for their detection and measurement

-----but we need to improve **IHC performance, choice of controls and interpretation of results.**

Disclosures; CRT –has consulting arrangements with for Philips, Agilent, PerkinElmer, Optra

Theme
Pathology is technology driven

ON SOME
MORBID APPEARANCES
OF
THE ABSORBENT GLANDS
AND
SPLEEN.

BY DR. HODGKIN.

PRESENTED
BY DR. R. LEE.

READ JANUARY 10TH AND 24TH, 1832.

THE morbid alterations of structure which I am about to describe are probably familiar to many practical morbid anatomists, since they can scarcely have failed to have fallen under their observation in the course of cadaveric inspection. They have not, as far as I am aware, been made the subject of special attention, on which account I am induced to bring forward a few cases in which they have occurred to myself, trusting that I shall at least escape severe or general censure, even though a sentence or two should be produced from some existing work, couched in such concise but expressive language, as to render needless the longer details with which I shall trespass on the time of my hearers.

Re: P980018
DAKO HercepTest
Filed: May 18, 1998
Amended: June 2, June 4, August 4, August 10, August 18, August 24, August 31 and September 25, 1998.

Dear Dr. Murray:

The Center for Devices and Radiological Health (CDRH) of the Food and Drug Administration (FDA) has completed its review of your premarket approval application (PMA) for the DAKO Herceptest. This device is a semi-quantitative immunohistochemical assay to determine HER2 overexpression in breast cancer tissues routinely processed for histological evaluation. HercepTest is indicated as an aid in the assessment of patients for whom HERCEPTIN® (Trastuzumab) treatment is being considered (see Herceptin package insert). We are pleased to inform you that the PMA is approved subject to the conditions described below and in the "Conditions of Approval" (enclosed). You may begin commercial distribution of the device upon receipt of this letter.

SUDDENLY THINGS CHANGED

-The 'quality' of IHC was no longer sufficient

-Quantification was at best an estimate

1998 – saw the first Companion Diagnostic
It marked the beginning of Precision Medicine.

A targeted therapeutic - is a 'drug' that----

- targets a specific molecule on a cell/tumor
- need to identify which patients respond

eg. HERCEPTIN therapy

eg. HER2

Detects

COMPANION DIAGNOSTIC

- **is a 'classifier'**

RESPONDERS V NON-RESPONDERS

KEY - Linked to defined therapeutic by data

eg. HERCEPT test

Response data

To use in this way IHC must be more than just a stain

Roche to Acquire Ventana for $3.4 Billion

By JEANNE WHALEN
January 23, 2008; Page A20

After trying for seven months to win over **Ventana Medical** Systems Inc., Swiss drug giant **Roche Holding** AG said it reached an agreement to acquire the U.S. diagnostics company for $3.4 billion.

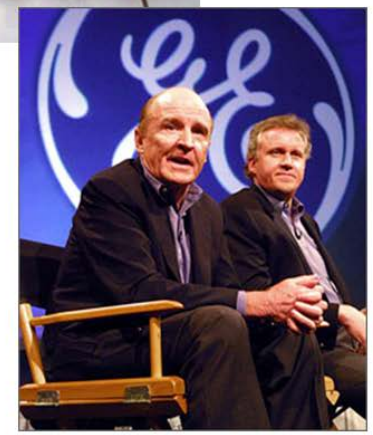
The deal advances Roche's aim of diversifying more into machines and other tools that help diagnose and monitor disease. Ventana's board approved the deal after Roche raised its offer by 19%. Ventana m… of infectious disease. Roche believes such tools will take up a greater share of health-care spending in the future.

Roche has mov… signs of trouble in the pharmaceutical industry have mounted. Sales of prescription drugs are growing at their slowest pace in years, and … medicines.

Roche's prescription-drug sales have fared better than those of many rivals, but the company is still hedging its bets by expanding more into diagnostics. In addition to Ventana, Roche in the past year has said it would acquire two other diagnostics companies: closely held NimbleGen Systems Inc., of Madison, Wis., for $272.5 million, and Bioveris Corp., of Gaithersburg, Md., for $600 million.

Are diagnostics the *new* wonder drug on Wall Street?

Franz Humer



FEEDING FRENZY - but concerns at many levels

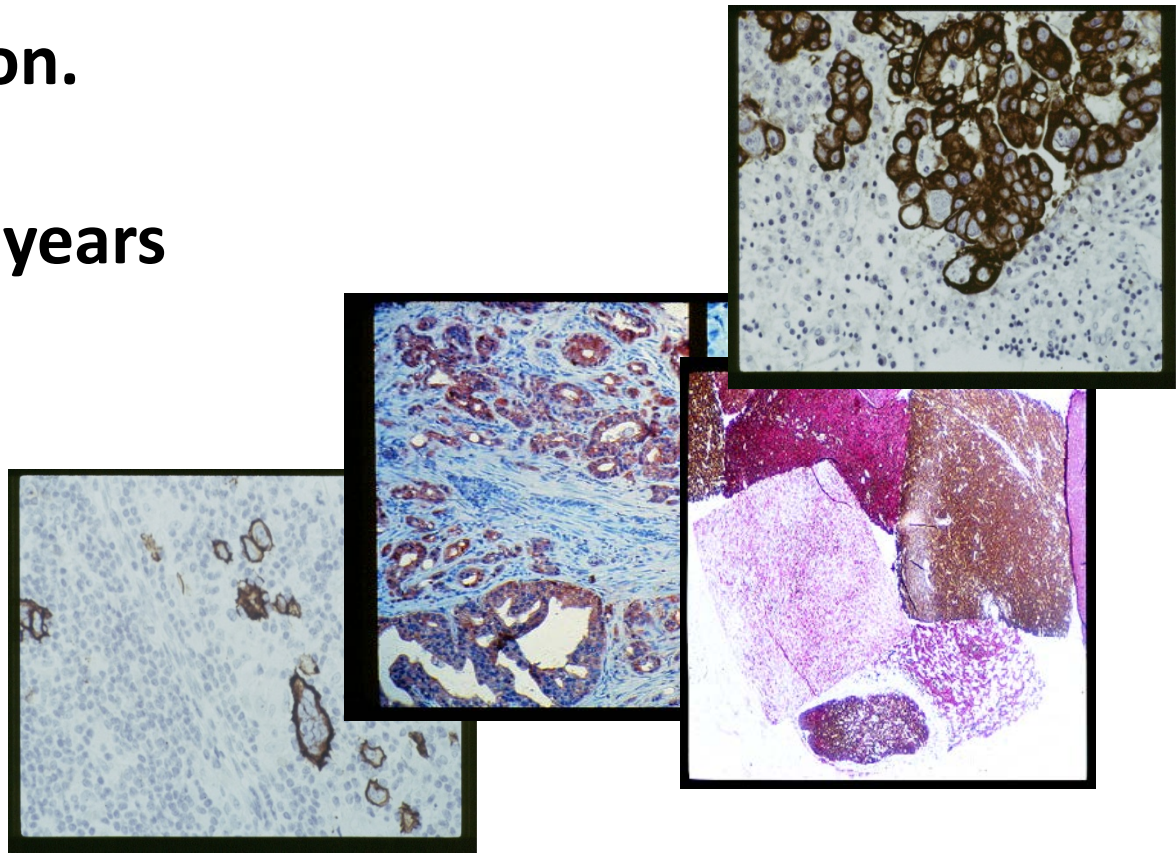
Gu, Taylor
AIMM 2014

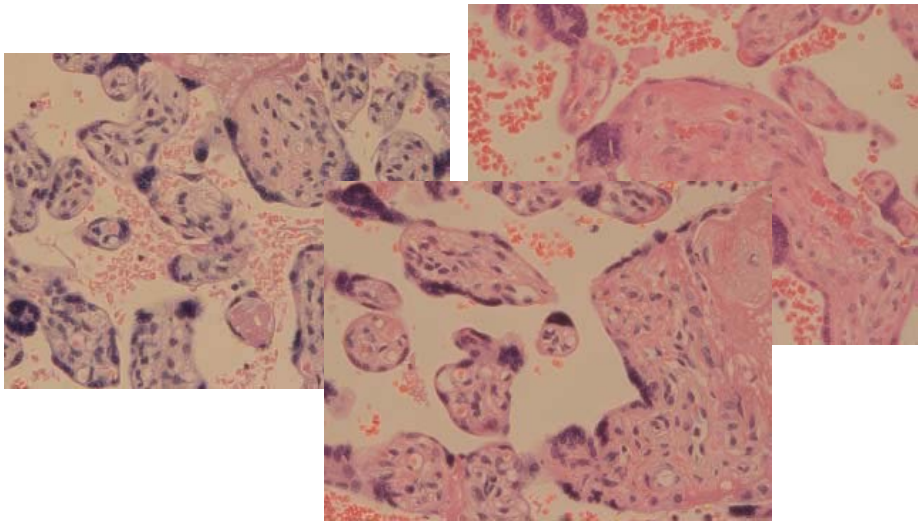
Up to this time IHC was used to produce 100 s of 'special stains' on FFPE tissues

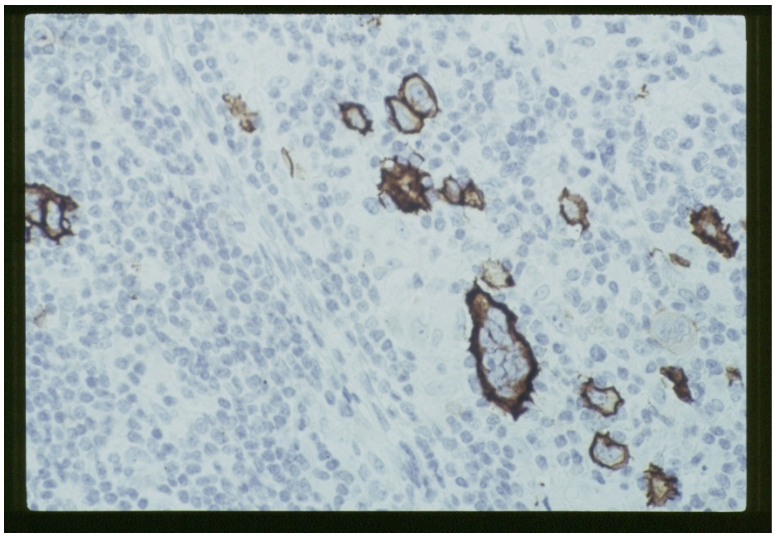
Same rationale as for any other stain, --to produce a different color to assist cell / tissue recognition.

But over the past 100 years this approach has produced some very bad habits



Routine stain H & E **'Special Stain' - IHC CD30**





No controls

The result is adjusted to 'please the pathologist'

MUST have positive and negative controls

Should **not** be adjusted to 'please the pathologist'

REPRODUCIBILITY IS POOR

run to run
day to day
lab to lab

Result

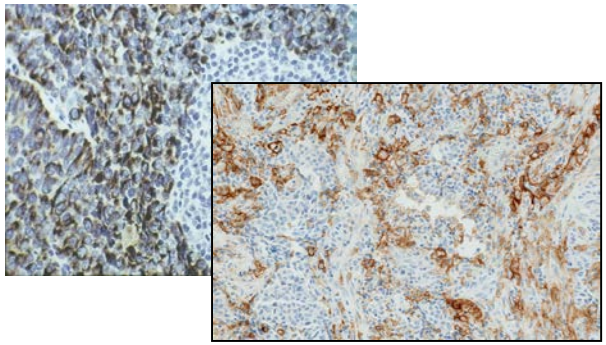
- IHC quality poor and variable

--- quantification not possible

So - what is the problem?

IHC detects targeted protein –

BUT - IHC is just a stain -

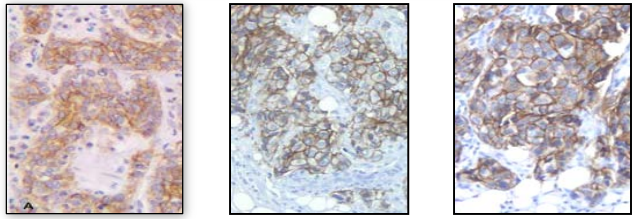


Can we achieve
--- consistency and the quality
to turn IHC into a
'quantitative' assay??

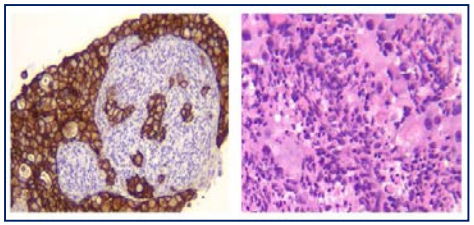
To convert a 'stain' to an 'assay'
Validation & Controls & interpretation must be more rigorous

Her2 result – current

+ *++* *+++*



Her2 result - quantitative
mean value surface expression
100 1000 10,000
attograms/cancer cell



In Situ Proteomics – ISP
Measuring protein per cell

Our IHC Problem

IHC

Right now IHC has elements of witchcraft -
-labs 'do their own thing'

1. Require a detailed strict protocol with controls

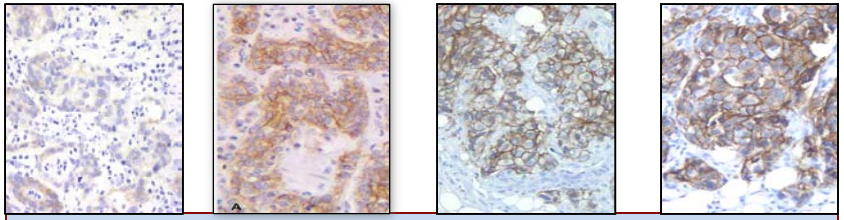
Can we achieve
-improved quality?
-true quantification?

2. Require that we follow the protocol exactly

3. Require BETTER controls to assure that we are doing it

The problem is in detail---
Can we 'control' the UNCONTROLLED VARIABLES?

"scoring" Predictive Markers is crude



0, 1+, 2+ 3+

IS THE SCORE 'REAL' ??

Is the variation 'real' = biology?
Or is it due to --

1. **'Poor sample preparation' - variable fixation**
2. **Variable section thickness**
3. **Variable IHC/AR Protocol / different labs**
4. **Variable chromogen development**
5. **Section heterogeneity**
6. **Variation in pathologist scoring / subjective**

Many 'uncontrolled' assay variables
How can we improve??
Better controls would be a good start

Taylor, Becker, AIMM 2011
Taylor AIMM 2014, CTR 2015

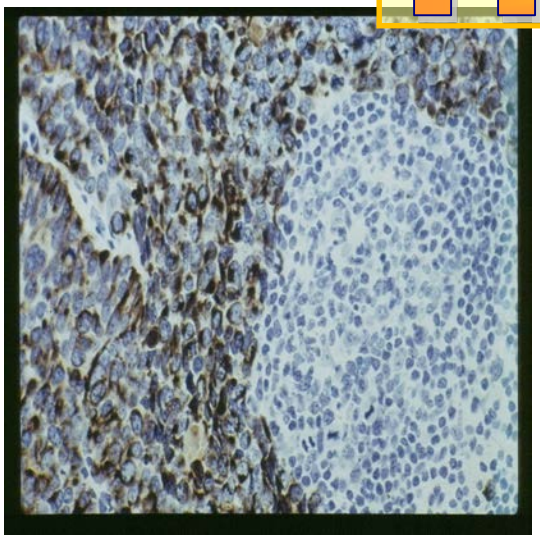
Part Solution ---- turn the Anatomic Pathology lab into a Clinical Lab

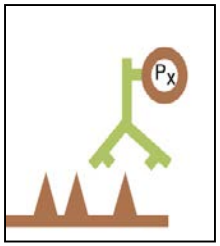
Clinical Lab
- Highly automated
- Strict protocols
- Validated reagents
- Rigorously controlled
- Universal reference standards

Regular AP lab
- none of these

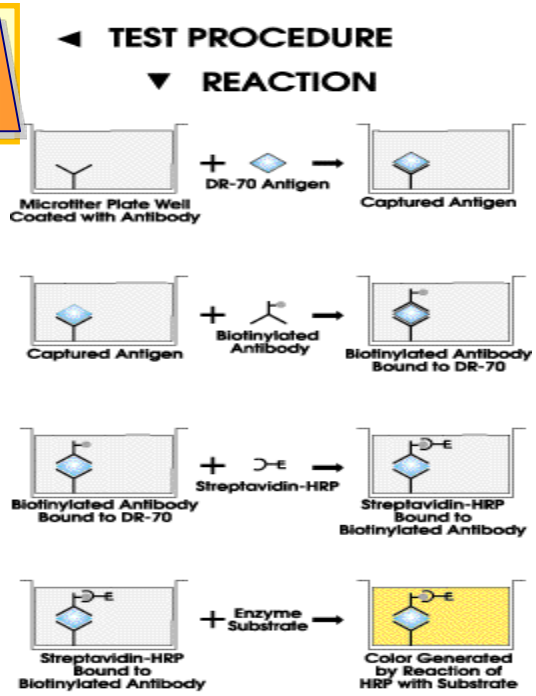
Multiple manual steps of IHC 'stain' are difficult to reproduce manually

I H C = ELISA





SAME REAGENTS
SAME PRINCIPLES



Immunohistochemistry = Enzyme Linked ImmunoSorbent Assay

Sample prep uncontrolled	←	Sample preparation controlled
Partly automated	←	Fully automated
No universal reference standard	←	Universal reference standard
Poor reproducibility	= = = = = = →	**Excellent reproducibility**
Not quantifiable	= = = = = = →	**Strictly quantitative**

True we cannot control everything – but there are some possible approaches to improvement of IHC

The model - Convert IHC to an ELISA type approach on tissue
- turn a 'qualitative stain' into a 'quantitative immunoassay'

1. **Consider all phases of IHC - THE TOTAL TEST**
2. **PRE-ANALYTIC - Control or Qualify Sample Preparation**
3. **ANALYTIC - Use same control materials in all IHC labs**
4. **ANALYTIC - Produce a Quantifiable Reference Standard for calibration**
5. **POST–ANALYTIC - Score Predictive Markers by digital analysis**

Within Lab and from Lab to Lab - Sample Preparation one of the biggest problems

PRE-ANALYTIC VARIABLES.

WARM ISCHEMIA – surgery, vessels clamped

COLD ISCHEMIA - (transport, fix?, gross schedule)

GROSSING – block size – penetration reagents

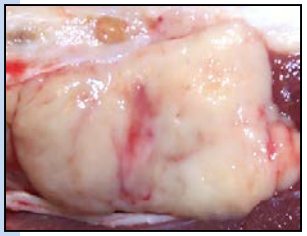
FIXATION – type, (formalin) freshness, pH, TOTAL TIME

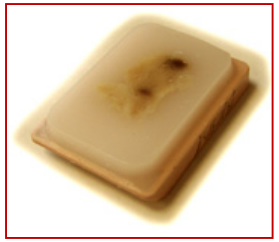
PROCESSING, - alcohol stages, xylol (TIME) paraffin temp

STORAGE - as block

CUTTING – thickness, evenness, tears

TIME LAPSE to staining

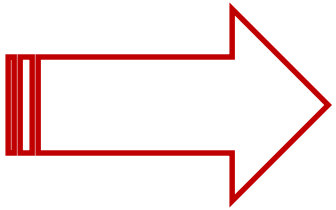




THE TOTAL TEST Standardization & Quantification in IHC
The Road to In Situ Proteomics.

Immunohistochemistry (IHC) to in situ proteomics (ISP)

a 'stain' → a measurement



STANDARDIZE & CONTROL EVERYTHING

Pre-analytic	Sample acquisition Fixation, processing, cutting
Analytic	Retrieval Reagents, Protocols, Basic controls,
Post-analytic	Interpretation, scoring Reporting

Analytic - No Shortage of Reagents

National Institute of Standards & Technology Reference Standard (control) - Requirements

Table 5 Summary of required characteristics of any reference standard that would provide a basis for accurate quantification of IHC on FFPE tissue

Immunohistochemical reference standard: requirements
It must be subjected to all of the same rigors of sample preparation (ischemia, transport, fixation) as the "test" tissue
It must be integrated into all steps of the test (assay) protocol, including evaluation of the result
It should contain a known amount of the reference standard protein
It should be universally available to all laboratories performing the assay
It should be inexhaustible and inexpensive

Taylor CR. **Quantitative In Situ Proteomics--**Cell Tissue Res. 2015; 360:109-120.

So what are the possibilities???

‘in house’ control tissue (block)

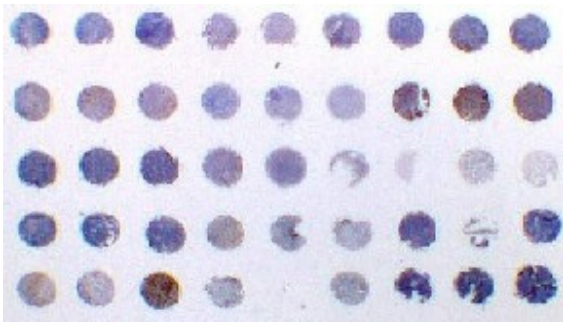
–is in fact an ‘external’ tissue control

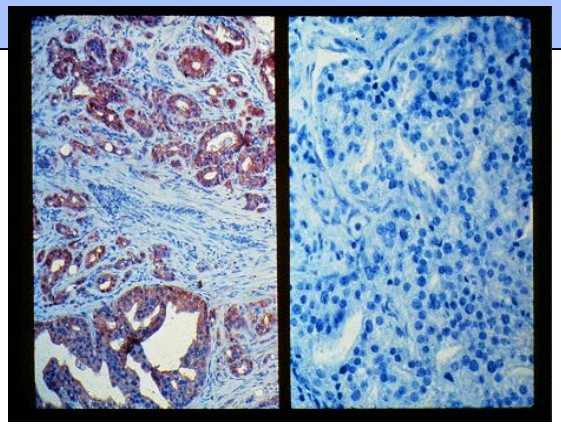
-- has similar but not same FFPE as test tissue

-- a finite amount of control tissue block(s)

- so a lab must make **new controls all the ti**
- and **every lab in fact has different control**

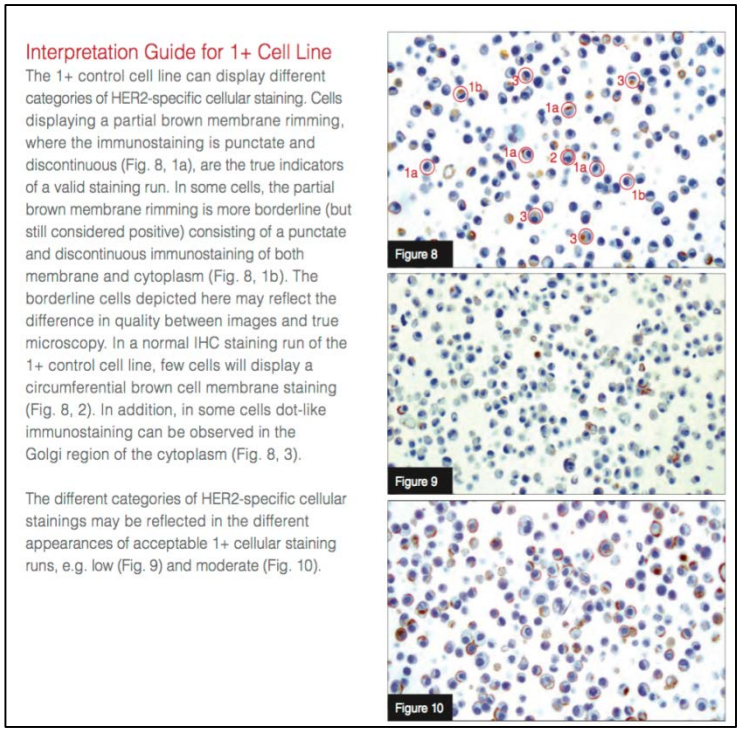
-- therefore not quantifiable





1998. HercepTest – included
Cell lines as ‘RUN’ controls
To assure greater consistency
- in labs
- and among labs

POTENTIAL NEW CONTROLS
Cell line controls should be validated in the context of their use
Note – do not control pre-analytic phase



Interpretation Guide for 1+ Cell Line

The 1+ control cell line can display different categories of HER2-specific cellular staining. Cells displaying a partial brown membrane rimming, where the immunostaining is punctate and discontinuous (Fig. 8, 1a), are the true indicators of a valid staining run. In some cells, the partial brown membrane rimming is more borderline (but still considered positive) consisting of a punctate and discontinuous immunostaining of both membrane and cytoplasm (Fig. 8, 1b). The borderline cells depicted here may reflect the difference in quality between images and true microscopy. In a normal IHC staining run of the 1+ control cell line, few cells will display a circumferential brown cell membrane staining (Fig. 8, 2). In addition, in some cells dot-like immunostaining can be observed in the Golgi region of the cytoplasm (Fig. 8, 3).

The different categories of HER2-specific cellular stainings may be reflected in the different appearances of acceptable 1+ cellular staining runs, e.g. low (Fig. 9) and moderate (Fig. 10).

Development of an Automated PD-L1 Immunohistochemistry (IHC) Assay for Non–Small Cell Lung Cancer

Therese Phillips, MA, Pauline Simmons, BS,* Hector D. Inzunza, MD, PhD,† John Cogswell, PhD,† James Novotny, Jr, PhD,† Clive Taylor, MD, PhD,‡ and Xiaoling Zhang, PhD**

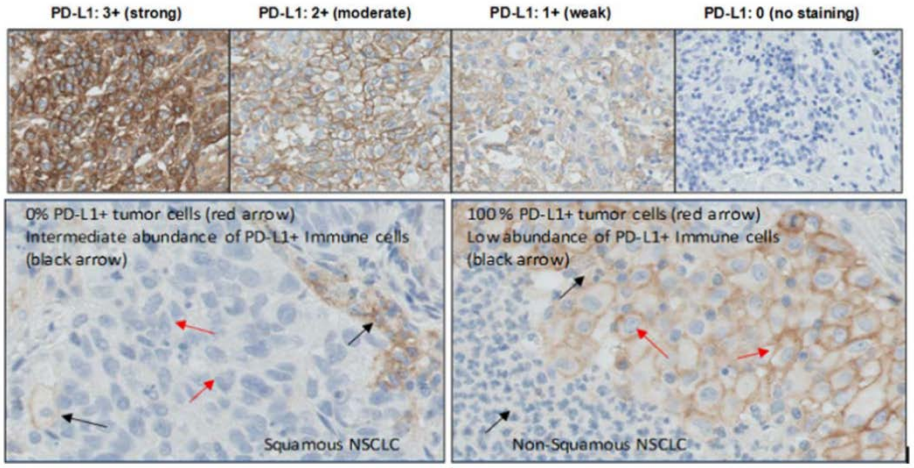

FIGURE 1. Positive PD-L1 membrane staining in NSCLC tumor tissues illustrating intensity grades (top, ×20) and PD-L1 tumor scores (bottom, ×40). NSCLC indicates non–small cell lung cancer; PD-L1, programmed cell death 1 ligand 1.

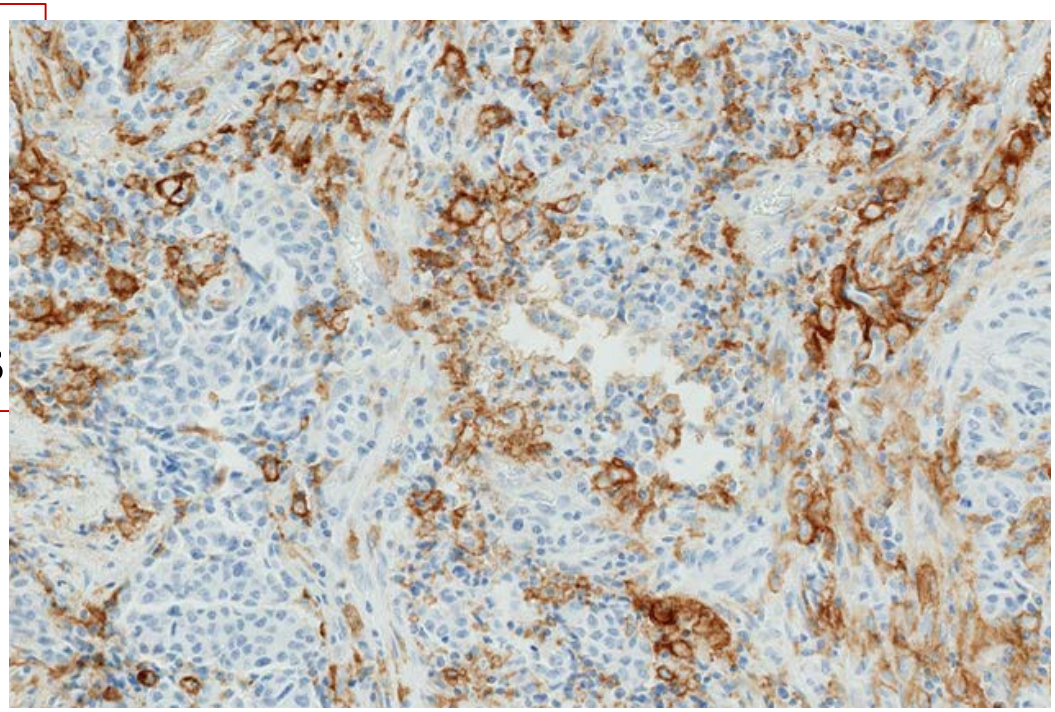
An approved Companion DX test – is validated vs clinical outcome

An FDA approved PDL-1 assay requires -
Validated method, reagents, controls & scoring – (manual in this case).

Challenges -
--Identification and scoring of cancer cells
--in some tests - Identification and scoring of immune cells
--Reproducibility

Look at the problem in the context of PD-L1

Many different antibodies
Many different approved tests



‘scoring systems’ - very complex

-differs among tests
-Is a cell positive?– threshold intensity
-Score Percentage positive?
--Semi-quantitative at best
-May include other difficult tasks
such as **presence of immune cells**

Scoring system - MUST be reproducible

First problem – percentage requires 'counting' the number of cancer cells that show 'positive staining' & TOTAL cancer cells by eye

X 4.
diam 5mm

X 10.
diam 2.0mm

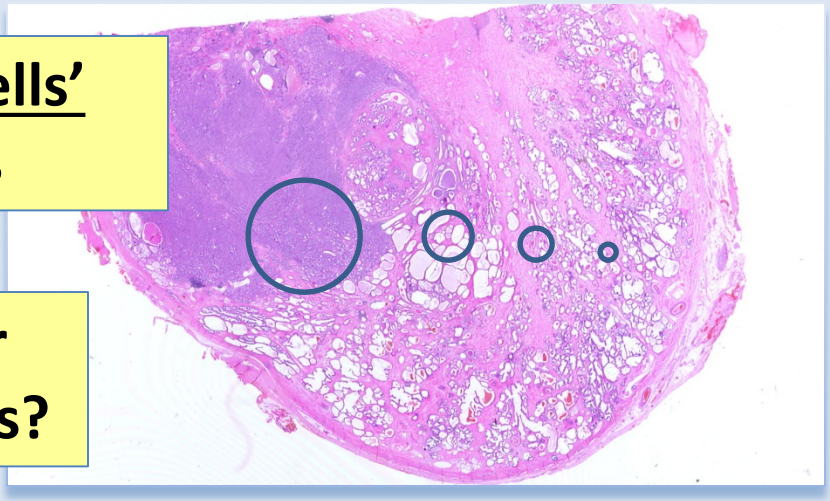
X 20.
diam 1 mm

X 40.
diam 0.5mm = 500µm

tissue (or whole slide image –WSI) 3 x 2 cms.

% = 'positive cancer cells' / total cancer cells

We put down a number -but really we just guess?



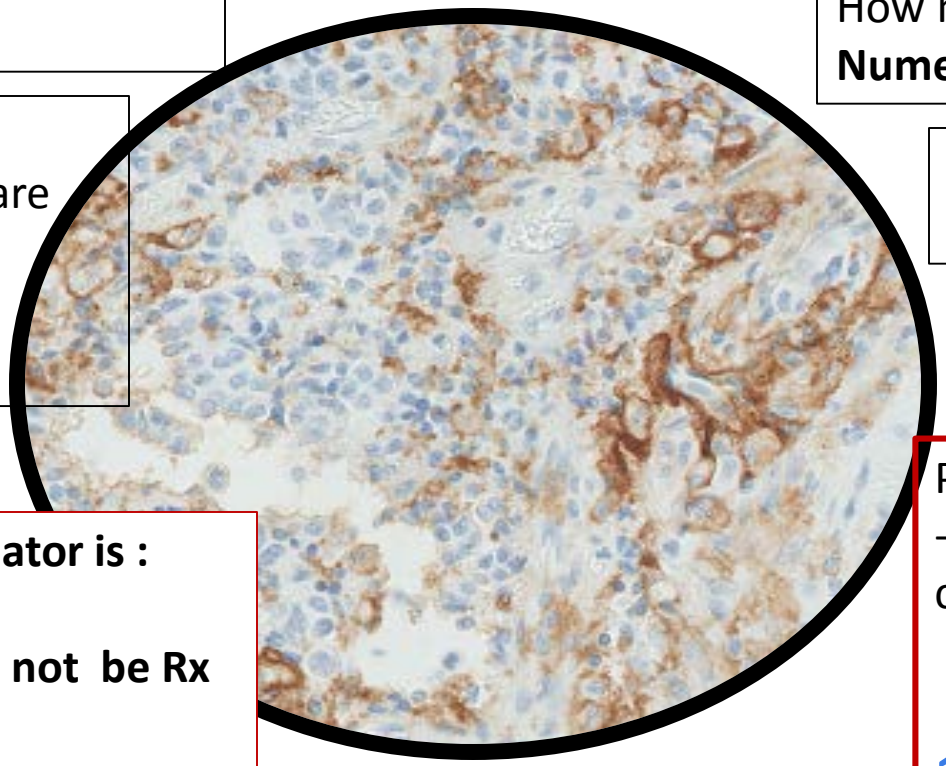
How many cancer cells per section? - --- up to 2,000,000 total cells per section
or per field (magnification)? - calculate πr^2 if tumor cell 20u diameter
then = 10,000 tumor cells per x 10 field
= 600 cells per x 40 field (varying with cell size, mix of tumor versus stroma)

What is the 'score'?
PD-L1 Threshold - 5%
Does the patient get treated or not?

ONE HIGH POWER X40 FIELD
Percentage positive = numerator: +ve cancer cells
denominator: total ca cells

How many total cancer cells
Denominator ?

Cannot count – so estimate that half are cancer cells ?
- 600 X ½
-- about 300



How many positive Ca cells?
Numerator ?

% = positive cell count / 300

But IF the denominator is :
- 330 (not 300)
- then '15' should not be Rx
or if 270
– then 14 should be Rx

But note -- we have only 'scored' 600 cells among maybe 2,000,000
or < 0.0003%

PDL-1 membrane stain
-- so count the positive cancer cells
15 cells= 5 % threshold

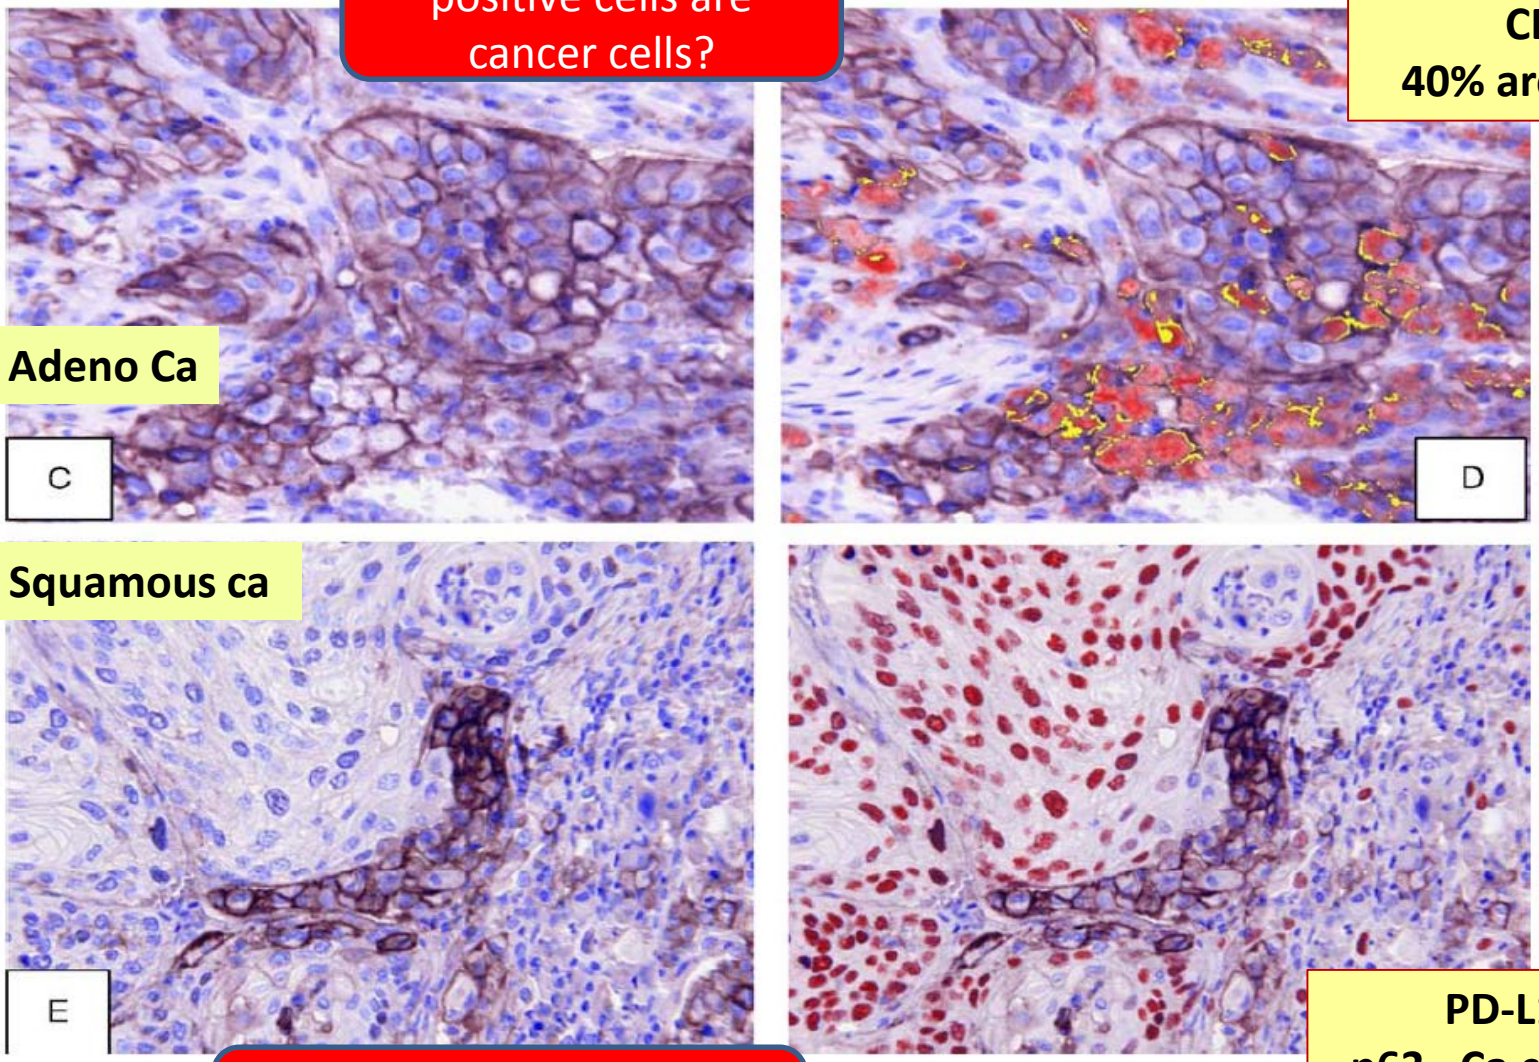
14 -no treatment
15 -- $100,000 Rx

Second problem- distinguish cancer cell from immune cells - by eye

How many of the positive cells are cancer cells?

PD-L1 - brown
CD 68 – red
40% are macrophages

Adeno Ca



Squamous ca

Is this a positive test?
>1%? > 5% ?

From Taylor AIMM 2014

PD-L1 - brown
p63– Ca cell nuclei - red
Negative test
Positive Ca cells = 0

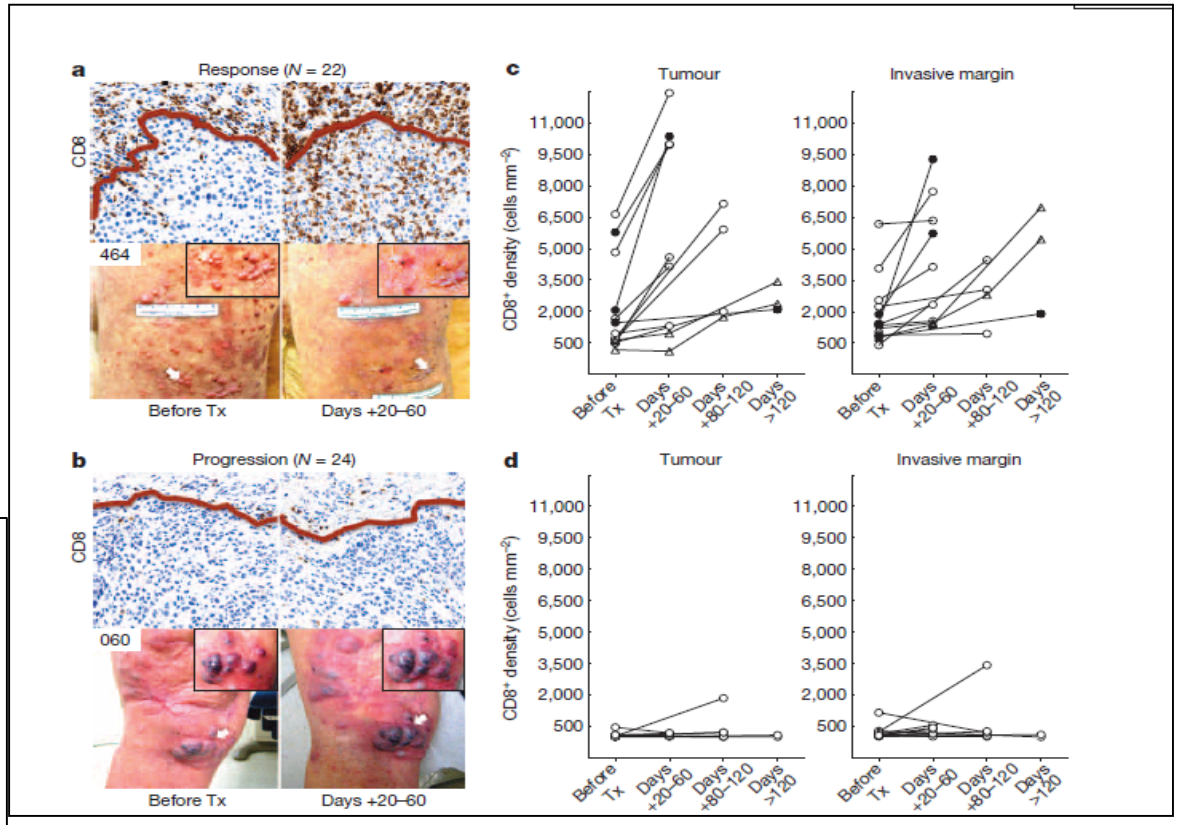
Third problem
- also need to evaluate immune cells by type and number

Cases with CD8 cells do well with PD-L1 Rx

Identify immune cells by phenotype

determine location in relation to tumor

How do we detect them?
MULTIPLEX IHC is effective
Include fluorescent methods
gives DIRECT INFORMATION



Tissue Extract methods
LOSE SPATIAL information

NGS **RNA**

PCR **Proteomics**

Tumeh P et al. PD-1 blockade induces responses by inhibiting adaptive immune resistance. Nature 515 568 2014

Leads to notion of two categories of cancer

-- require very different therapeutic approaches

Immunogenic
'inflamed'
Response suppressed

non immunogenic
'silent'
Immune cells absent

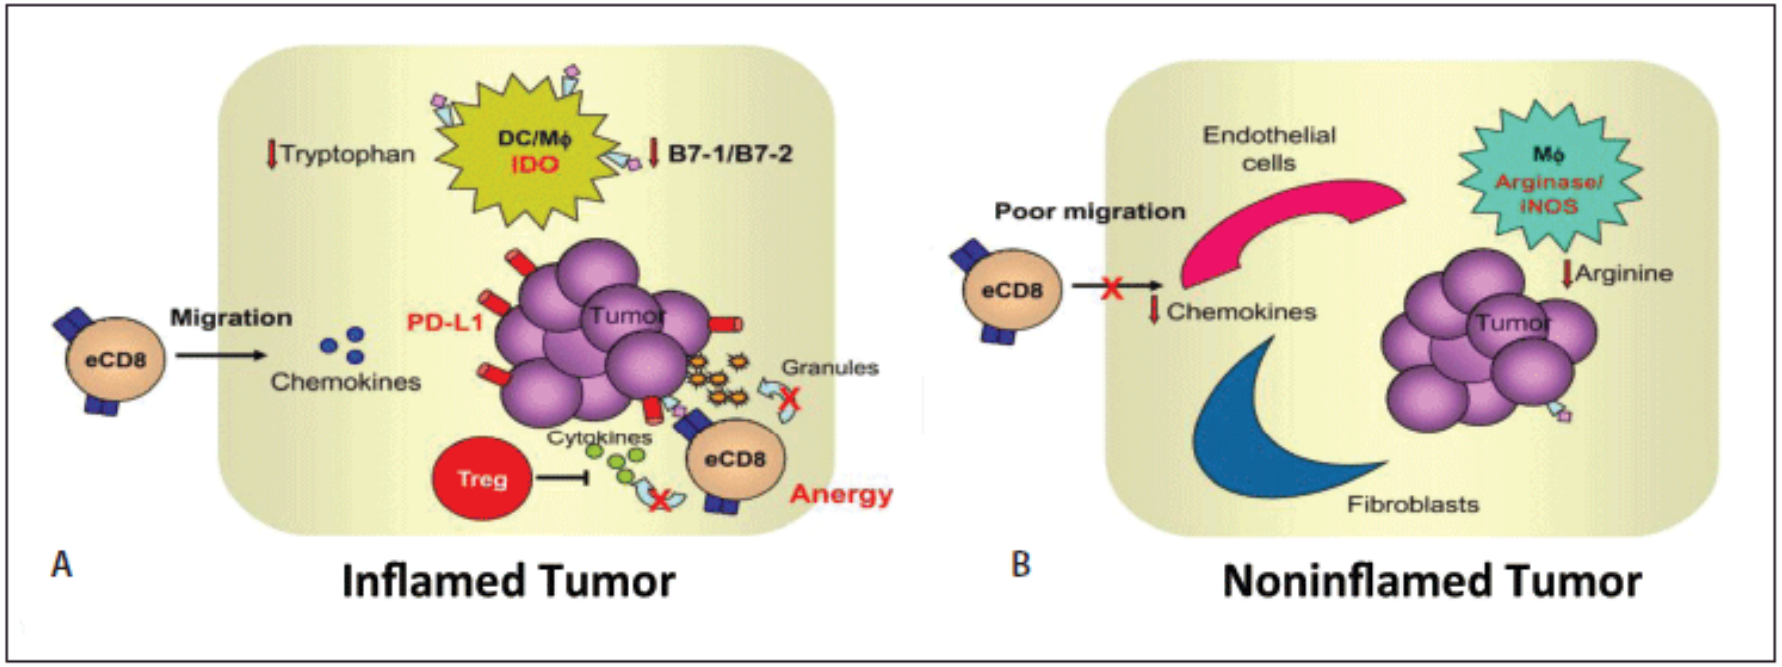


Figure 1: Two Distinct Mechanisms of Immune Resistance—**(A)** Inflamed tumors express high levels of pro-inflammatory innate and adaptive immune signals, such as chemokines for T-cell recruitment, but negative immune regulators dominate, including Foxp3+ T-regulatory cells, programmed death 1 ligand (PD-L1), and IDO; **(B)** non-inflamed tumors express few chemokines and have few tumor-infiltrating lymphocytes, due to poor effector cell trafficking. They have high expression of vascular markers and abundant macrophages and fibroblasts. From Gajewski et al. Curr Opin Immunol. 2011.[9] Used with permission.

Inflamed vs 'silent' cancers
Pathologists need to make the distinction - **HOW??**

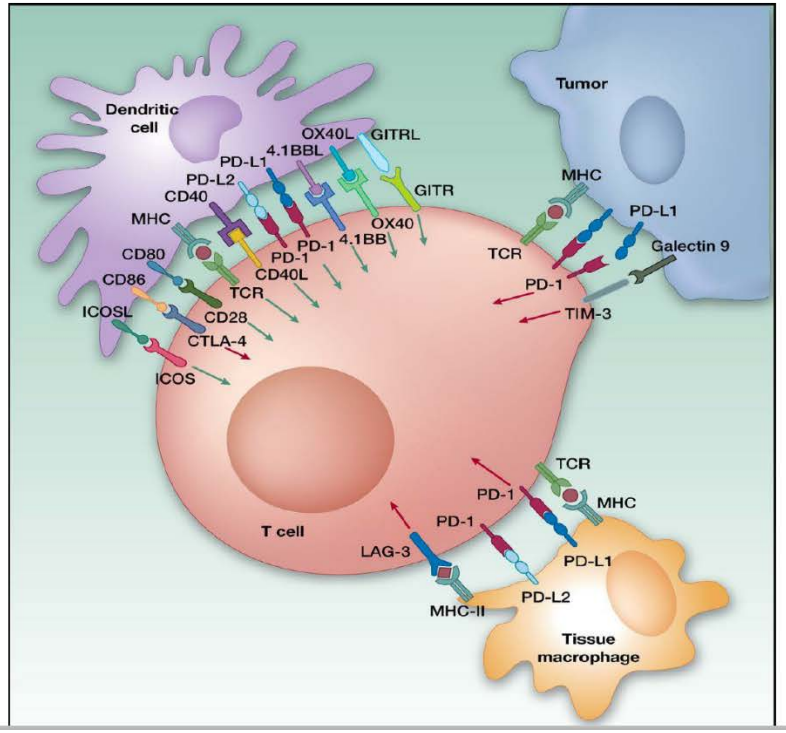
REQUIRES MULTIPLE MARKERS

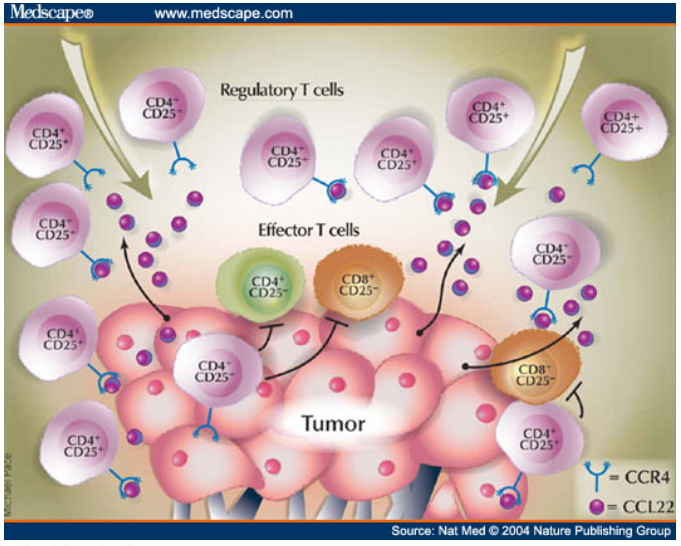
Tissue Section
Digital multiplex IHC FISH

Ligand pairs
PD 1 PDL 1
CD40 CD40L
CTLA-4 CD 86
OX40 OX40L
GITR GITR L

Retains ---
Tumor cell ID
Cell relationships
Cell numbers

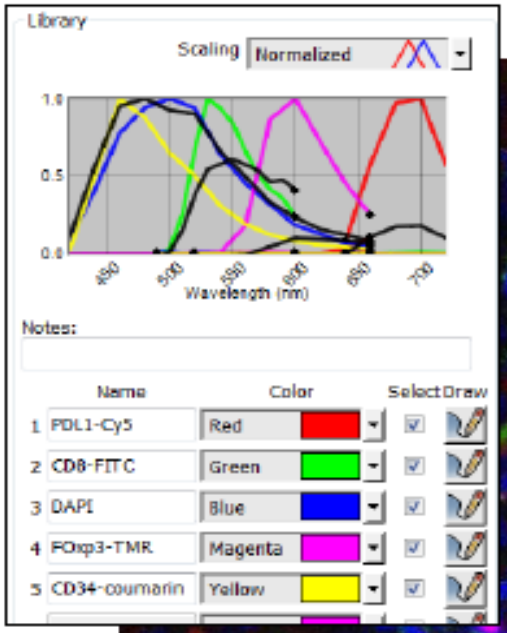
Immune Cell phenotypes
CD3 CD4 CD8 CD25
CD20 CD68 FoxP1 etc





Patrick A. Ott et al.
Clin Cancer Res 2013;19:5300-5309

Multiplex IHC may help solve these problems
because it can do all of these things at the same time



a. **Detect BIOMARKER expression**

b. **Achieve better cell ID**
Immune cell phenotyping

c. **quantification= counting**
Accurate scoring

d. **Quantification = amount**
--comparing intensity versus internal standard

April 2017
FDA approved
For Primary Diagnosis

Whole slide imaging (WSI), also known as digital pathology is an emerging technology. It involves the acquisition of images from stained tissue sections on glass slides. The images are converted into digital images that can be viewed on a monitor. Digital pathology can elevate collaboration between labs/specialists and allows easy consultation across distances. The digitized images can be archived and accessed in a moments time. The digital pathology platform (Philips Intellisite Pathology Solution) used in this study is intended for in vitro diagnostic use as an aid to the pathologist to view, review and diagnose digital images of surgical pathology slides. Before substituting the time-honored, familiar and versatile microscope with digital microscopy, several valid concerns need to be addressed. The most critical issue is whether pathologic diagnoses rendered using WSI are comparable to (i.e., non-inferior to) pathologic diagnoses made by optical microscopy. Although several studies comparing digital vs optical microscopy in diagnosis have been conducted, these studies have been single or small multicenter studies, sampling a single organ or lacking central adjudication. This large multi center non-inferiority study compares microscopy to WSI reads of 2000 surgical pathology cases from 20 different organ systems (54 subtypes) with 16 reading pathologists from 4 institutions.

OBJECTIVES

Primary objective:
- Demonstrate that diagnosing surgical pathology slides with a digital pathology platform was non-inferior to using an optical microscope.

Secondary objective
- Comparison of Manual Digital (MD) and Manual Optical (MO) discordance rates for organs, subtypes and pathologists.

METHODS

Retrospective blinded randomized non-inferiority study comparing MD to MO for primary diagnosis in surgical pathology.

Acceptance criteria
Digital microscopy would be declared non-inferior to the optical microscope if the upper bound of the 95% two-sided confidence interval for the overall MD – MO difference in major discordance rate (compared to the main diagnosis) was less than 4%.

Major discordance
A difference in diagnosis that would be associated with significant difference in patient management

CLINICAL STUDY DESIGN

- 4 Clinical sites
- 27 Pathologists for:
  - Case enrollment (4)
  - Validation (4)
  - Reading (16)
  - Adjudicating (3)
- 2,000 Cases
- 16,000 Reads:
  - 4 Pathologists per case
  - Read MO and MD
  - Wash out 4 weeks

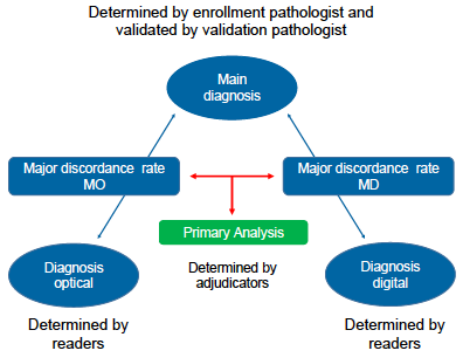

Figure 1: Study design

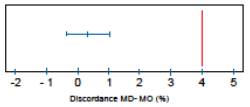
Table 1. Cases included in the study by organ system

Study Site	Organ system	No of cases
1	Colorectal	150
	Urinary bladder	99
	Gynecologic	150
	Liver/bile duct, neoplastic	49
	Brain	60
	Total (site 1)	508
2	Prostate	299
	Lymph node	100
	Endocrine	100
	Kidney, neoplastic	50
	Salivary	50
	Total (site 2)	599

Study Site	Organ system	No Cases
3	Gastroesophageal junction	115
	Skin	177
	Hernial/peritoneal	7
	Gallbladder	10
	Appendix	10
	Soft tissue tumors	21
	Anus/perianal	50
	Total (site 3)	390
4	Breast	299
	Lung/bronchus/larynx/oral cavity/nasopharynx	95
	Stomach	99
	Total (site 4)	495
	Total for all four sites (full analysis set)	1992

RESULTS



Left CI	Average	Right CI
-0.31	0.35	1.00

Figure 2: Difference in major discordance rate digital - optical (%)

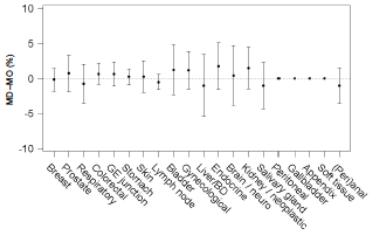


Figure 3: Difference major discordance rates (MD – MO) by organ

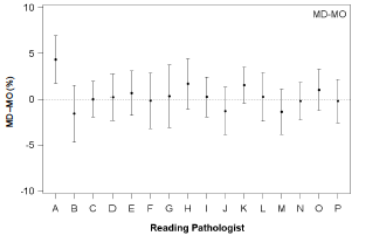

Figure 4: Difference major discordance rates (MD – MO) by reading pathologist

CONCLUSIONS

Manual Digital is non-inferior to Manual Optical for primary diagnosis in surgical pathology

Manual Digital is non-inferior to Manual Optical across a wide range of organ systems and pathologists

Summary - IHC - to improve quality and to quantify
- what must be done?

CONTROL - preparation-fixation (**qualify** tissues)
DEFINE - Analytes (protein targets)
VALIDATE - Reagents
VALIDATE / STANDARDISE - Total Method as a whole
DEVELOP - uniform 'shared' control systems
DEVELOP – quantitative internal reference standards
DEVELOP - standard interpretation/scoring by computer

and ALL OF THESE STEPS REQUIRE IMPROVED CONTROLS
and all require 'monitoring'
