# IHC – Protocols and controls for Breast tumours

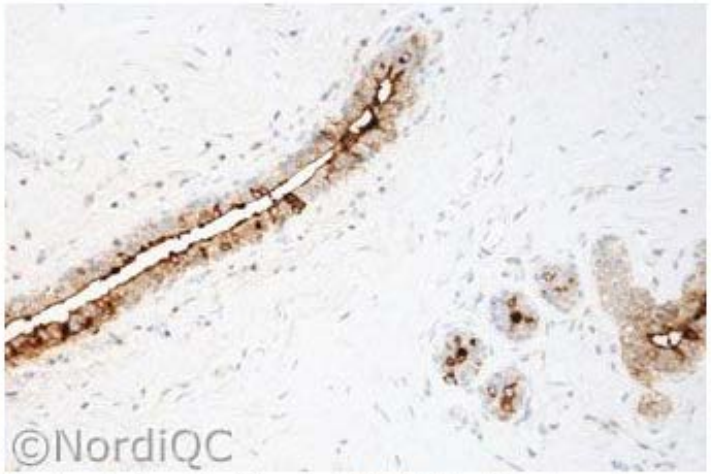

Fig. 1a. Optimal staining for GCDFP-15 of the breast hyperplasia using the mAb clone 23A3 optimally calibrated as a concentrate, HIER in an alkaline buffer and a polymer based detection system. The majority of the ductal epithelia cells show a distinct moderate to strong cytoplasmic staining reaction. Also compare with Fig. 2a – same protocol.

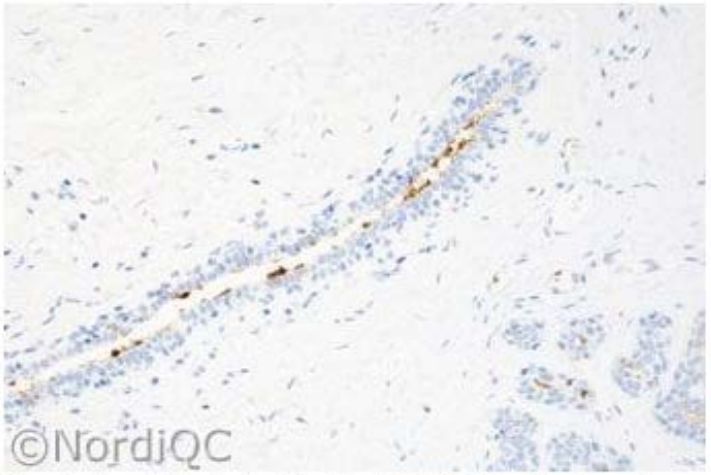

Fig. 1b. Insufficient staining for GCDFP-15 of the breast hyperplasia applying the mAb clone 23A3 as a concentrate using exactly the same protocol settings as used in Fig 1a, except for a 20 fold dilution of the primary antibody. The proportion and the intensity of the cells demonstrated are significantly reduced compared to the result in Fig. 1a. Also compare with Fig. 2b – same protocol.

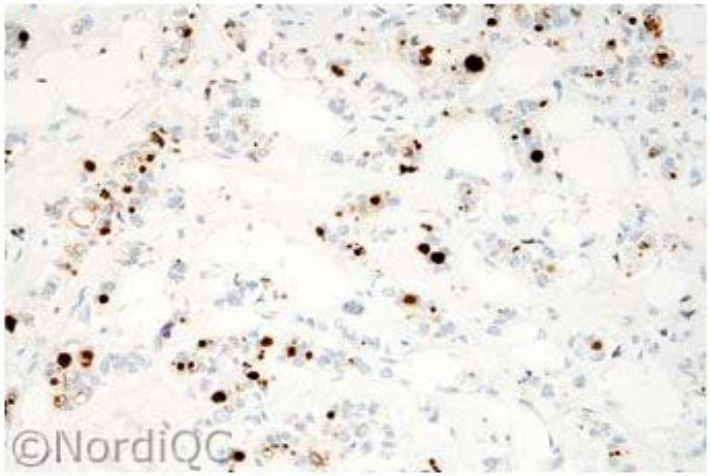

Fig. 2a. Optimal staining for GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1a. The majority of the neoplastic cells show a moderate to strong dot-like cytoplasmic staining reaction.

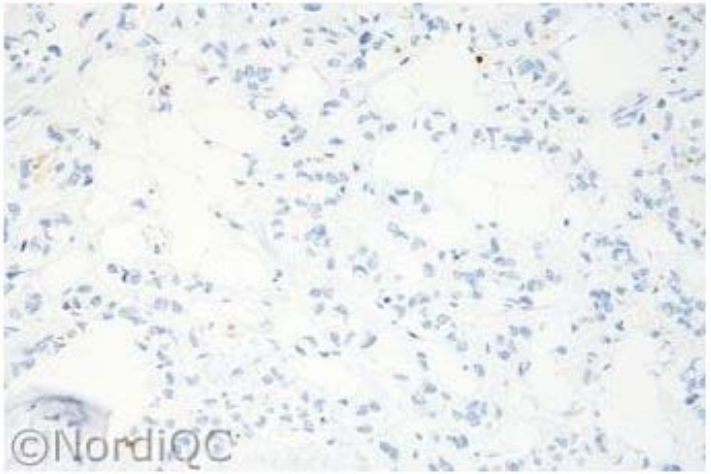

Fig. 2b. Insufficient staining GCDFP-15 of the breast carcinoma no. 5 using same protocol as in Fig. 1b. - same field as in Fig. 2a. Only scattered neoplastic cells show a faint dot-like reaction.

# IHC – Protocols and controls for Breast tumours

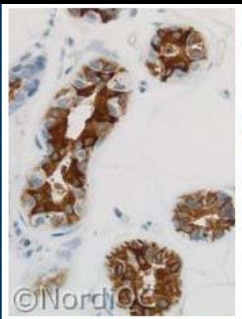
1) Proportion of sufficient stains (optimal or good), 2) Proportion of sufficient stains with optimal protocol settings only, see below.



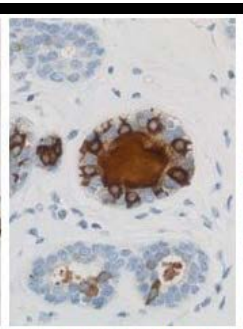


Fig. 1a. Optimal staining for mammaglobin using the mAb clone 304-1A5 optimally calibrated and with HIER.
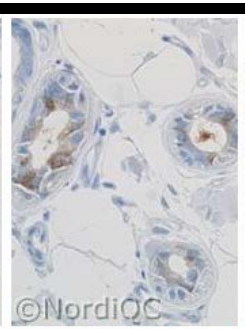
Left: Skin: The majority of the epithelial cells of the eccrine sweat glands show a distinct cytoplasmic reaction.
Right: Breast: The apocrine metaplastic cells and few ductal epithelial cells show a distinct cytoplasmic reaction.
Also compare with Figs. 2a & 3a – same protocol.



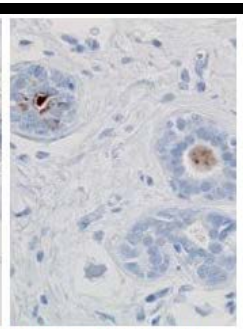


Fig. 1b. Insufficient staining for mammaglobin using the mAb clone 304-1A5 too diluted.
Left: Skin: Only scattered epithelial cells of the eccrine sweat glands show a weak cytoplasmic reaction.
Right: Breast: The epithelial cells are virtually negative and only extracellular mucus is demonstrated. Also compare with Figs. 2b & 3b – same protocol.

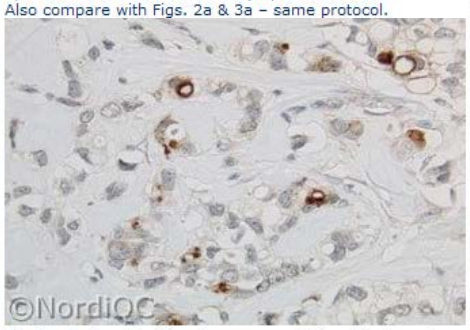

Fig. 3a. Optimal staining for mammaglobin of the breast carcinoma no. 5 using same protocol as in Fig. 1a & 2a. The majority of the neoplastic cells show at least a weak cytoplasmic reaction and focally a dot-like staining.

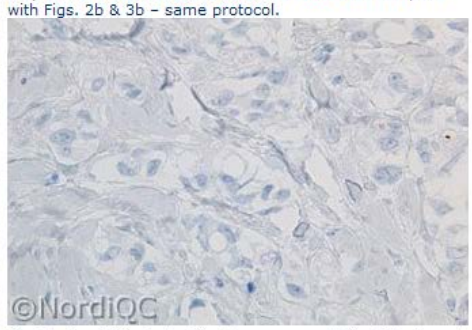

Fig. 3b. Insufficient staining for mammaglobin of the breast carcinoma no. 5 using same protocol as in Fig. 1b & 2b. None or only a dubious reaction is seen in the neoplastic cells.

# IHC – Protocols and controls for Breast tumours

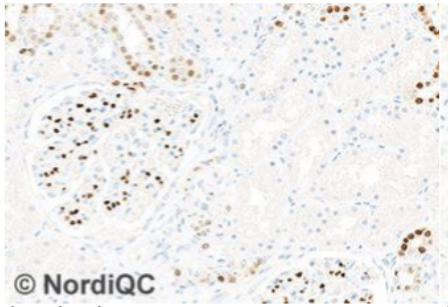

Fig. 1a (x200)
Optimal GATA3 staining of the kidney using the mAb clone L50-823 as a concentrate, optimally calibrated with HIER in an alkaline buffer (CC1 pH 8.5, Ventana) and a 3-step multimer based detection system (UltraView, Ventana). A moderate to strong nuclear staining reaction is seen in the majority of epithelial cells lining the collecting ducts and in podocytes in glomeruli. Same protocol used in Figs. 1a - 4a.

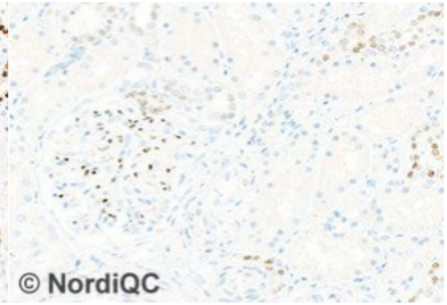

Fig. 1b (x200)
Insufficient GATA3 staining of the kidney using the mAb clone L50-823. The protocol provided an overall reduced sensitivity primarily caused by a too low concentration of the primary Ab. The intensity and proportion of cells demonstrated is reduced compared to the level expected - same field as in Fig. 1a. Also compare with Figs. 2b - 4b, same protocol.

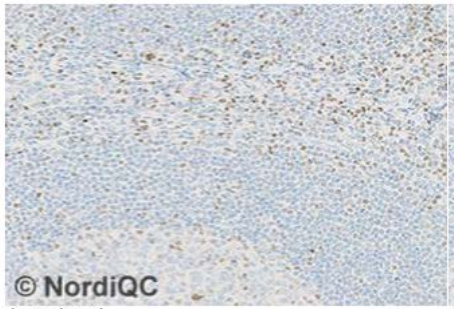

Fig. 2a (x200)
Optimal GATA3 staining of the tonsil using same protocol as in Fig. 1a. T-cells primarily located in the T-zones but also within the germinal center show a weak to moderate, distinct nuclear staining reaction. No background staining

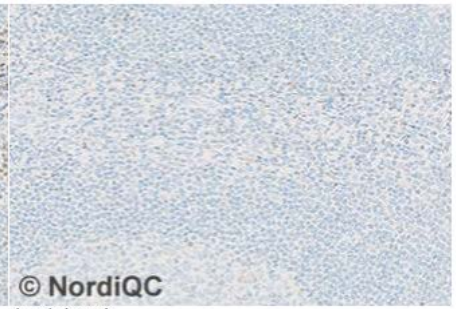

Fig. 2b (x200)
Insufficient GATA3 staining of the tonsil using same protocol as in Fig. 1b – same field as in Fig. 2a. Virtually no staining reaction of T-cells is seen. Also compare with Figs. 3b and 4b, same protocol.

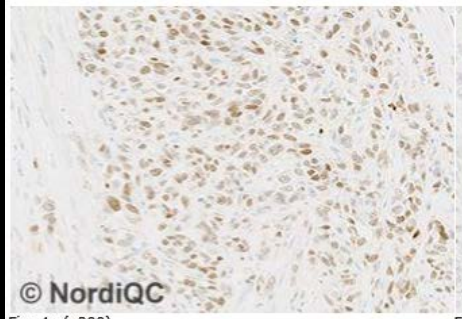

Fig. 4a (x200)
Optimal GATA3 staining of the urothelial carcinoma using same protocol as in Figs. 1a - 3a. The majority of neoplastic cells show a distinct, weak to moderate nuclear staining reaction.

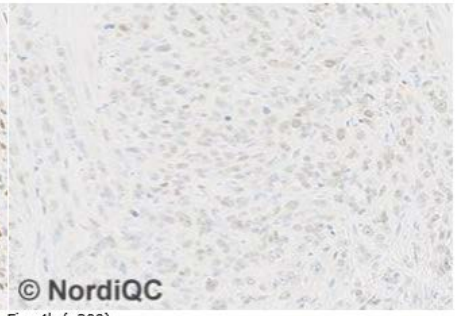

Fig. 4b (x200)
Insufficient GATA3 staining of the urothelial carcinoma using same protocol as in Figs. 1b – 3b – same field as in Fig. 4a. Only a weak and equivocal nuclear staining reaction in dispersed neoplastic cells is observed.

# IHC – Protocols and controls for Breast tumours

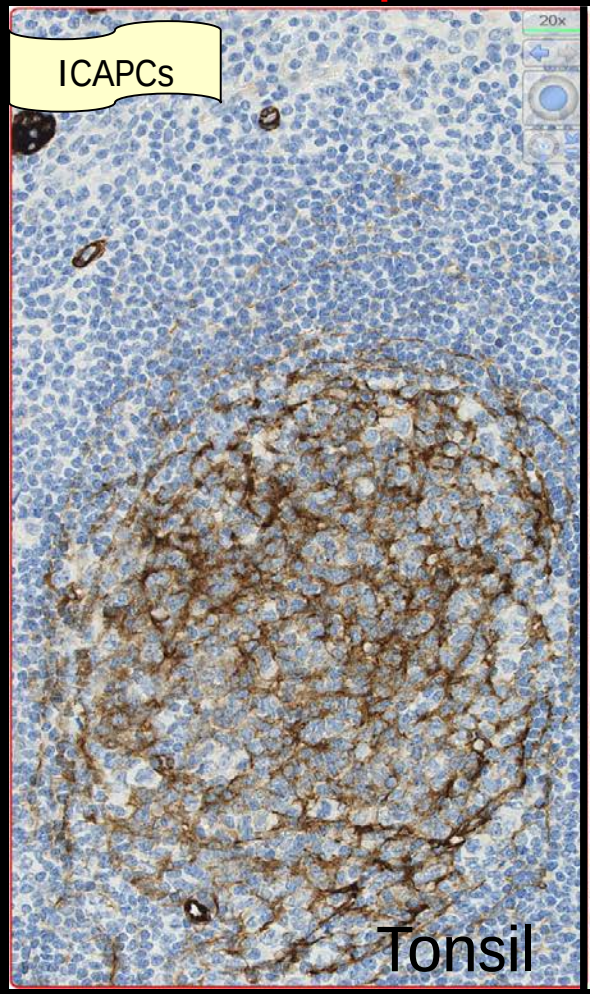
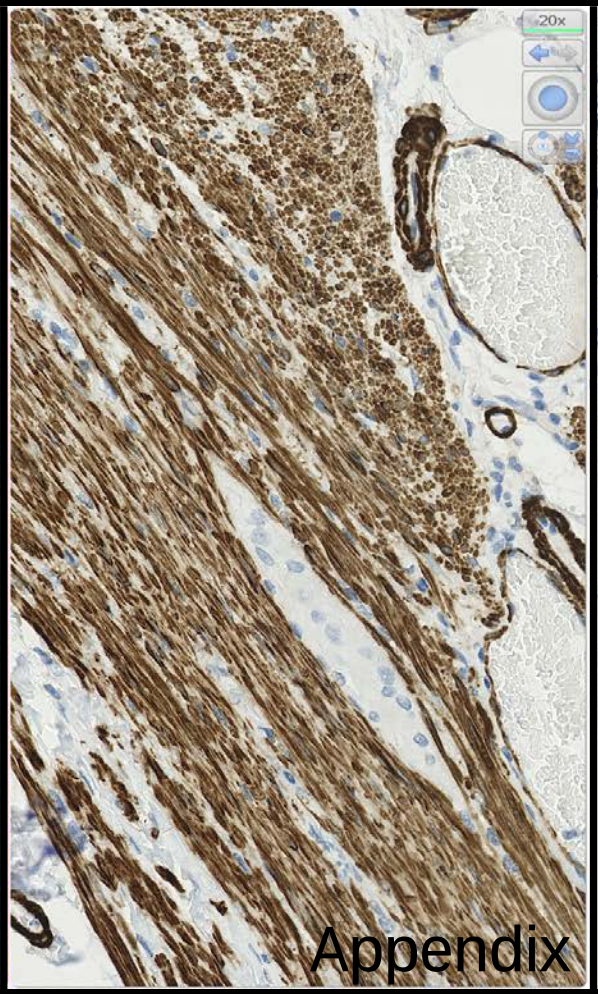
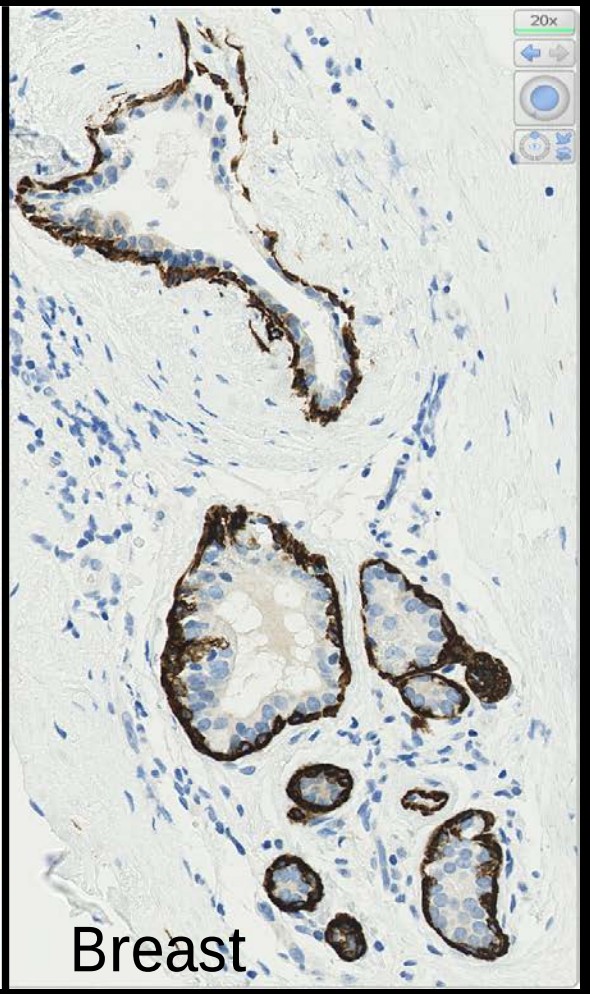
## SMH reaction pattern



A weak to moderate, distinct cytoplasmic staining reaction in the follicular dendritic network of germinal centres. No staining should be seen in epithelial cells.



A moderate to strong, distinct cytoplasmic staining reaction of all smooth muscle cells in muscularis propria and vessels. No staining in epithelium.



A moderate to strong cytoplasmic staining reaction must be seen in myoepithelium. No staining reaction should be seen in luminal epithelial cells.

# IHC – Protocols and controls for Breast tumours

# IHC – Protocols and controls for Breast tumours

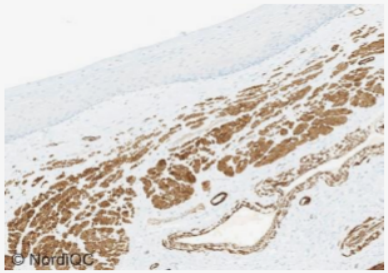

Fig. 1a
Optimal staining for SMH of the esophagus using the mAb clone SMMS-1 within a laboratory developed assay optimally calibrated, using HIER in an alkaline buffer and a 3-step multimer based detection system.
Virtually all smooth muscle cells in vessels and lamina muscularis mucosae show a moderate to strong cytoplasmic staining reaction.
Also compare with Figs. 2a – 5a, same protocol.

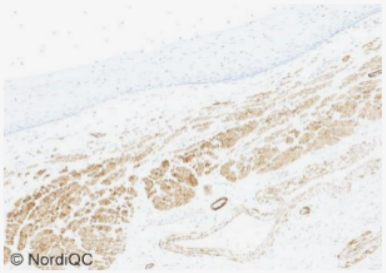

Fig. 1b
SMH staining of the esophagus using an insufficient protocol based on the mAb clone SMMS-1 within a laboratory developed assay providing a too low analytical sensitivity. A too low titre of the primary Antibody and the use of 2-step multimer system, UltraView Ventana, were the main causes for the insufficient result, which especially is seen in Figs. 2b - 5b – same protocol.
In esophagus – same field as Fig. 1a, a moderate staining reaction is seen in virtually all smooth muscle cells.
As described in the assessment report, smooth muscle cells cannot be recommended as positive tissue control for SMH due to the high level of SMH expression.

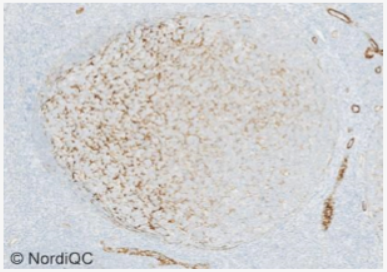

Fig. 2a
Optimal SMH staining of the tonsil using same protocol as in Fig. 1a.
A weak to moderate staining reaction is seen in the follicular dendritic network in the germinal center.
A high signal-to-noise ratio is observed.

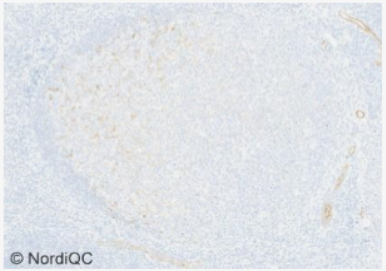

Fig. 2a
Insufficient SMH staining of the tonsil using same protocol as in Fig. 1b.
The follicular dendritic network in the germinal center is virtually negative and only vascular smooth muscle cells are demonstrated.

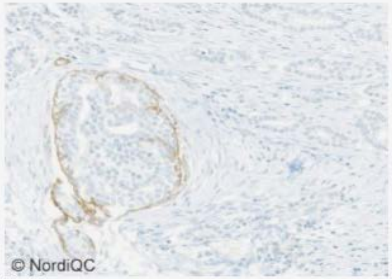

Fig. 5a
Optimal SMH staining of the breast ductal carcinoma using same protocol as in Figs. 1a - 4a.
A moderate, distinct and continuous staining reaction is seen in the myoepithelial cells lining the breast DCIS component, while the invasive components show no staining.

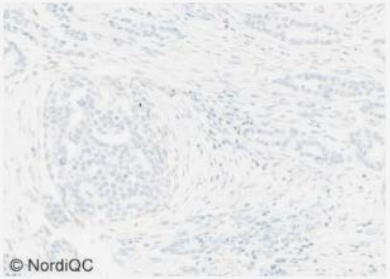

Fig. 5b
Insufficient SMH staining of the breast ductal carcinoma using same protocol as in Figs. 1a - 4a.
No staining is seen in neither the DCIS nor the invasive components and thus not possible to differentiate these two entities.

Choice of right tissue controls

Calibrate for the purpose of the assay

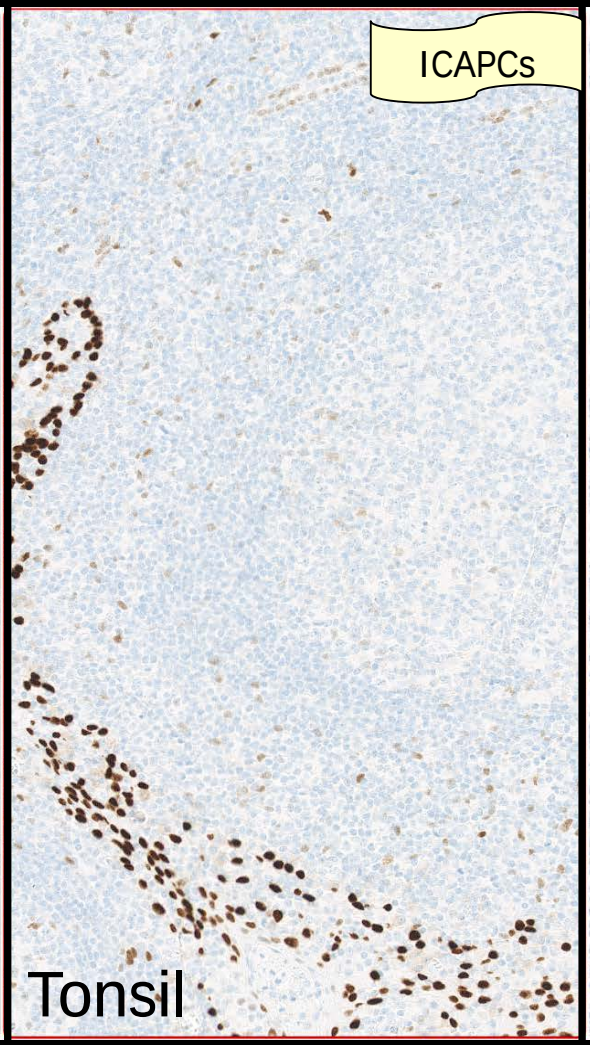
SMH as marker to differentiate DCIS vs carcinoma

# IHC – Protocols and controls for Breast tumours

## p63 reaction pattern

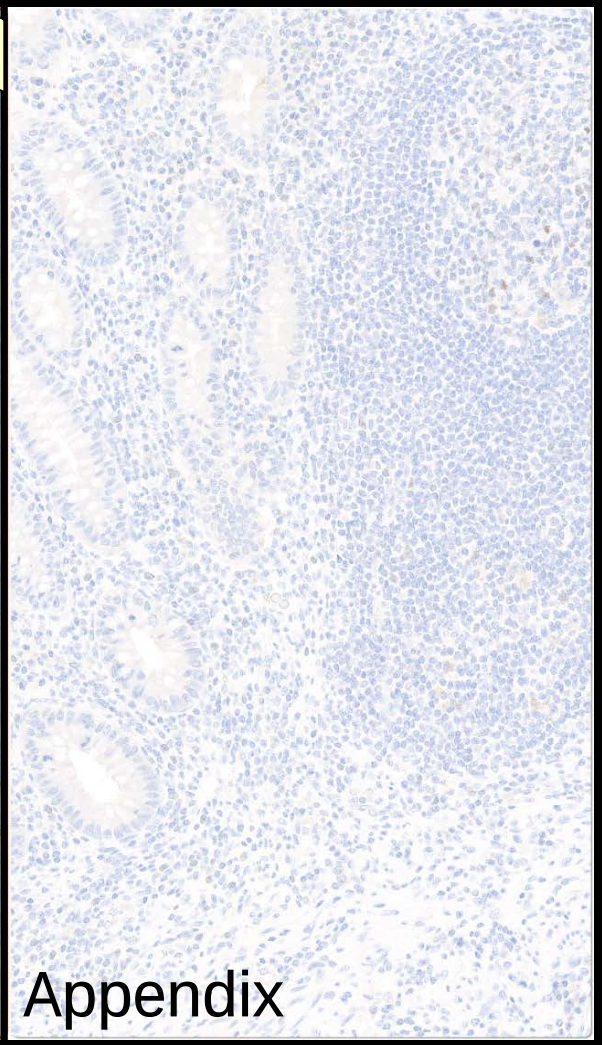
Esophagus / Tonsil

A moderate to strong distinct nuclear staining reaction in the vast majority of squamous epithelial cells.



Tonsil

An at least weak but distinct nuclear staining reaction of scattered lymphocytes and endothelial cells.



Appendix

No staining reaction in columnar epithelial cells – scattered lymphocytes can be expected to be demonstrared.

# IHC – Protocols and controls for Breast tumours

# IHC – Protocols and controls for Breast tumours

p63 / RUN 41 2014

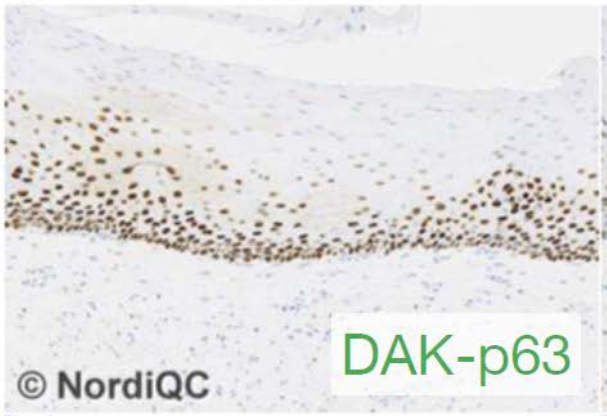

Fig. 1a
Optimal p63 staining of the esophagus using the mAb clone DAK-p63 (Dako RTU) with HIER in an alkaline buffer (TRS pH 9.0, Dako) and performed on the Dako Autostainer. A strong nuclear staining reaction is seen in the majority of the squamous epithelial cells in the esophagus. No background staining is seen. Same protocol used in Figs. 1a - 4a.

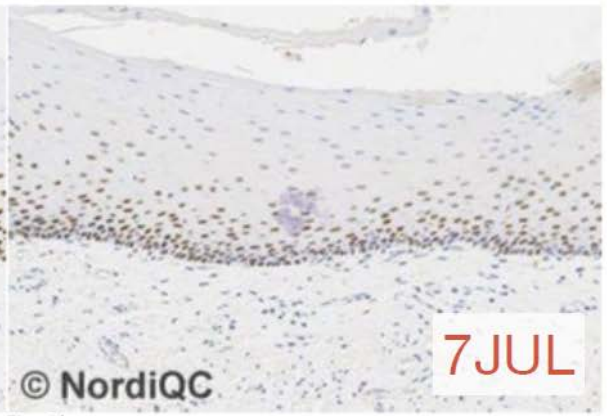

Fig. 1b
Insufficient p63 staining of the esophagus using the mAb clone 7JUL (Leica/Novocastra, 1:100) with HIER in an alkaline buffer (BERS2, Bond) and performed on the Bond III, Leica. A moderate nuclear staining reaction is seen in the majority of the squamous epithelial cells in the esophagus. Compare with Fig. 1a – same field. Also compare with Figs. 2b, 3b and 4b – same protocol.

Primary antibody with a too low sensitivity.

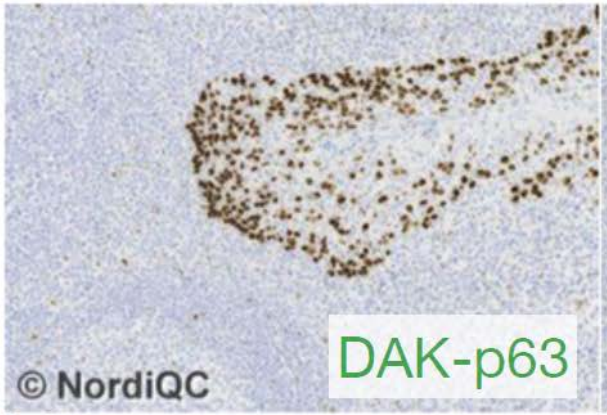

Fig. 2a
Optimal p63 staining of the tonsil using the same protocol as in Fig. 1a. A moderate to strong, distinct nuclear staining is seen in virtually all the squamous epithelial cells in the tonsil. In addition to the epithelial staining a weak but distinct nuclear reaction is present in scattered lymphocytes in the tonsil.

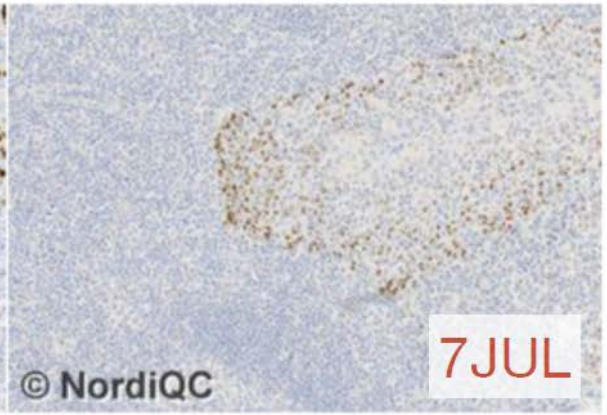

Fig. 2b
Insufficient p63 staining of the tonsil using the same protocol as in Fig. 1b. A weak to moderate, distinct nuclear staining is seen in the majority of the squamous epithelial cells in the tonsil. But in the insufficient protocol no staining is seen in lymphocytes. Compare with Fig. 2a. - same field.

# IHC – Protocols and controls for Breast tumours

p63 / RUN 41 2014

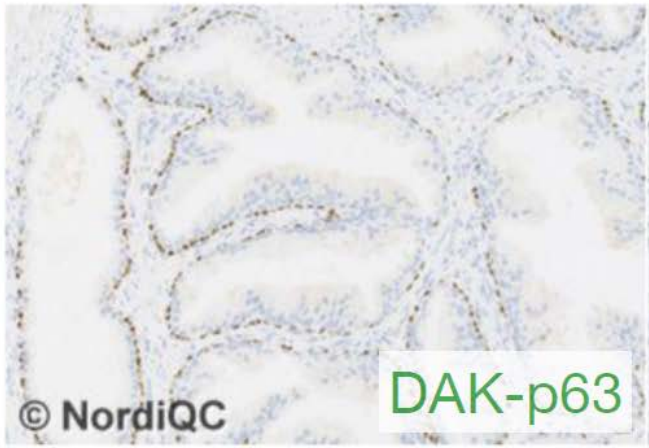

Fig. 3a
Optimal p63 staining in the prostate hyperplasia using the same protocol as in Figs. 1a & 2a. Virtually all the basal cells show a moderate to strong distinct nuclear staining reaction. No background staining is seen.

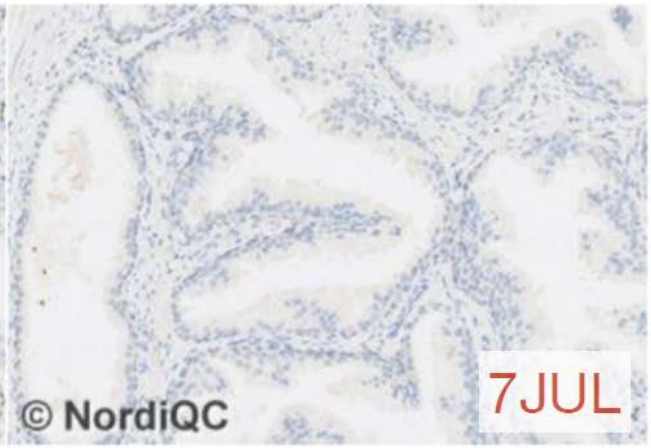

Fig. 3b
Insufficient p63 staining in the prostate hyperplasia using the same protocol as in Figs. 1b & 2b. Virtually all basal cells in the prostate hyperplasia are negative. Compare with Fig. 3a – same field.

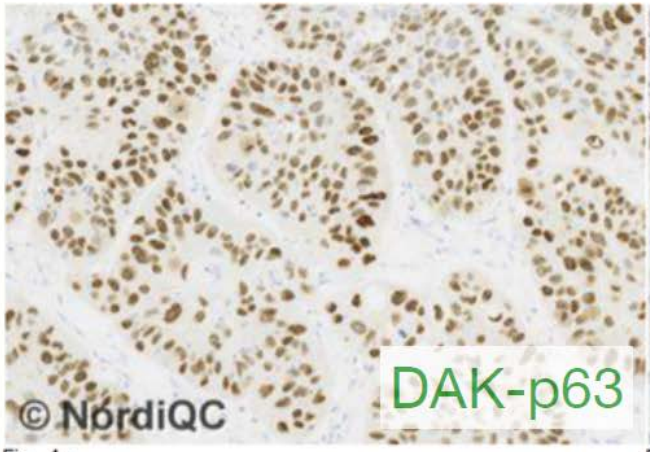

Fig. 4a
Optimal p63 staining of the lung squamous cell carcinoma using the same protocol as in Figs. 1a, 2a & 3a. Virtually all the neoplastic cells show a moderate to strong nuclear staining reaction. No background staining is seen.

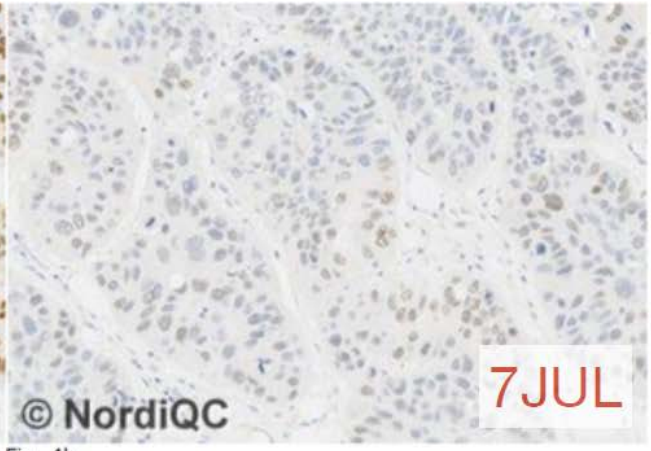

Fig. 4b
Insufficient P63 staining of the lung squamous cell carcinoma using the same protocol as in Figs. 1b, 2b & 3b. Only faint nuclear staining is seen and only in a minor fraction of the neoplastic cells. Compare with Fig. 4a – same field.

Primary antibody with a too low sensitivity.

# IHC - Protocols and controls for Breast tumours

p63 / RUN 41 2014

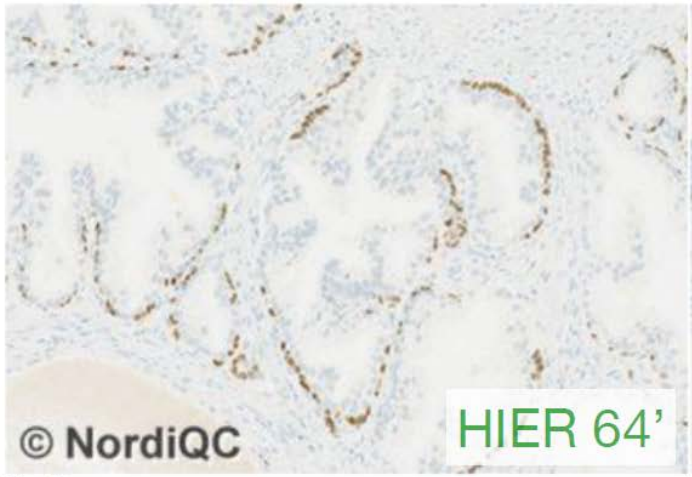

Fig. 5a
Optimal p63 staining of the prostate hyperplasia using the mAb clone 4A4 (Ventana, RTU) with HIER in CC1 (Ventana) for 64 min. Moderate to strong nuclear reaction is seen in virtually all basal cells. Efficient HIER pretreatment is essential to optimal P63 staining. Compare with Fig. 5b.

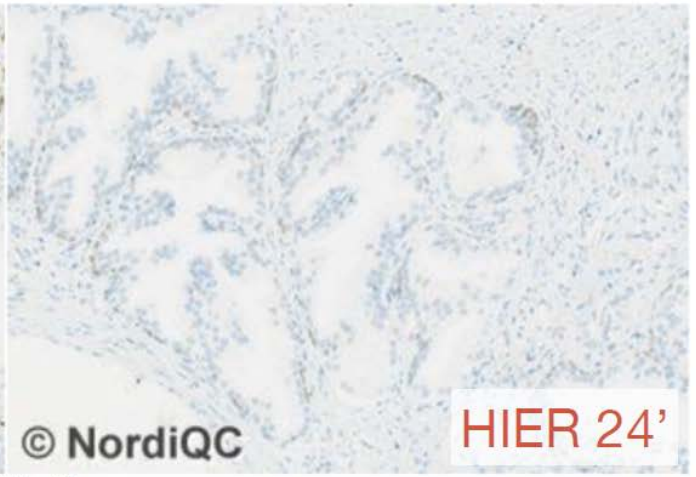

Fig. 5b
Insufficient p63 staining in the prostate hyperplasia using the mAb clone 4A4 (Ventana, RTU) in the same protocol as in Fig. 5a, except for the reduction in HIER pretreatment to 24 min compared to the 64 min i Fig 5a. Consequenctly a dramatic reduction in staining intensity is seen making the identification of the basal cell difficult. Compare with Fig. 5a – same field.

Insufficient HIER.

# IHC – Protocols and controls for Breast tumours

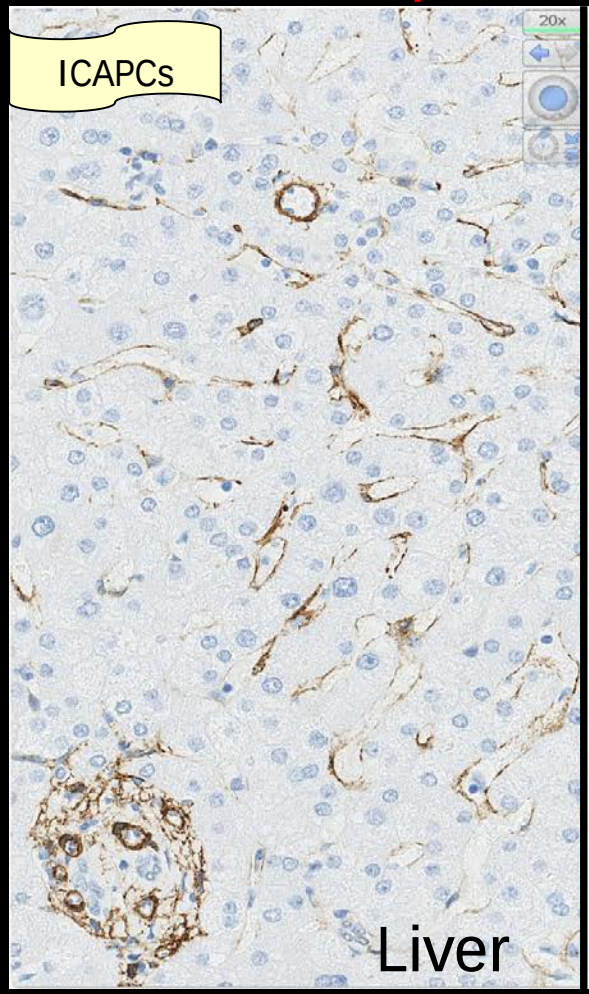
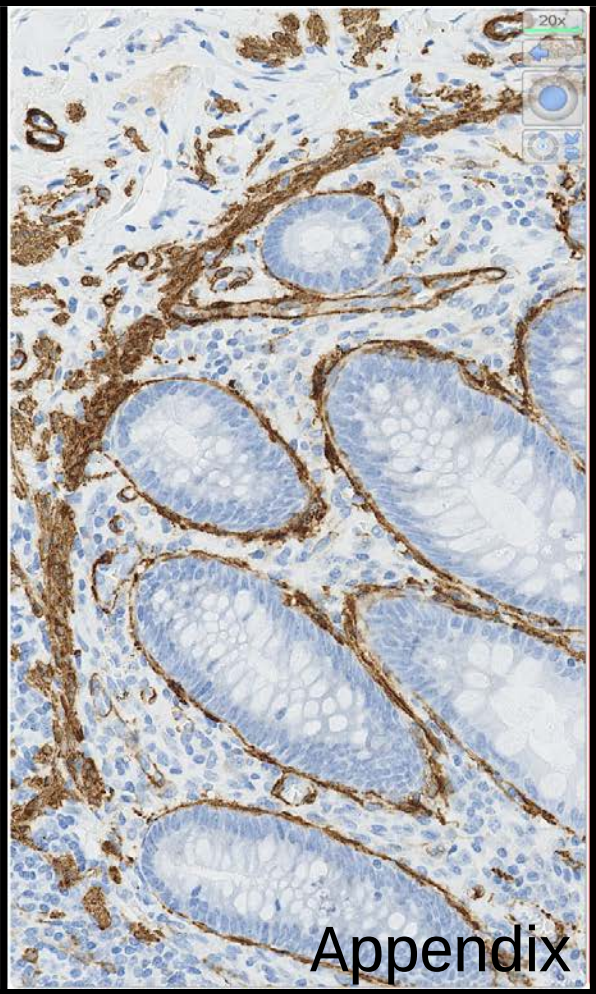
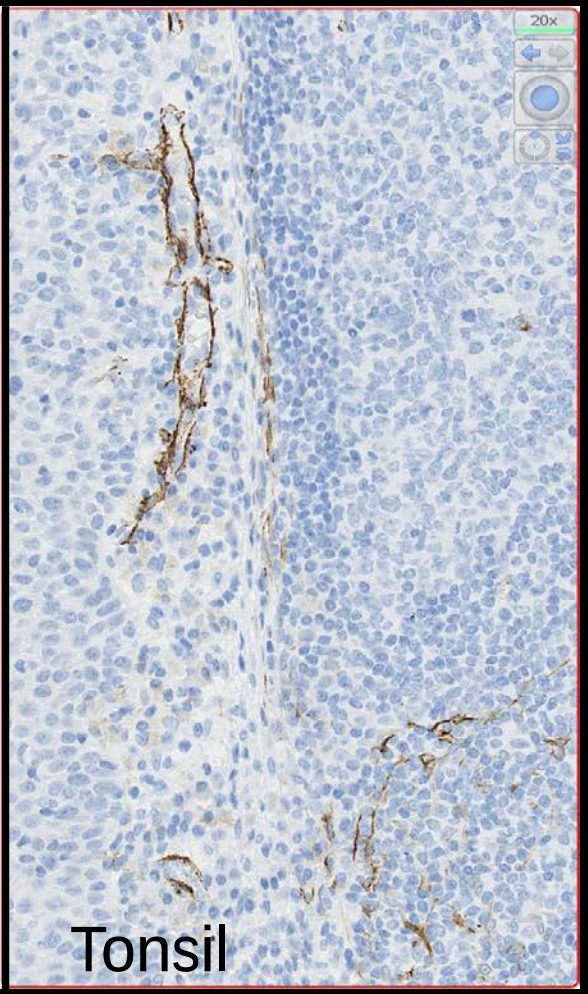
## ASMA reaction pattern



A moderate to strong, distinct cytoplasmic staining of the majority of the perisinusoidal cells in the liver. No staining should be seen in hepatocytes.



A strong, distinct cytoplasmic staining of all the smooth muscle cells in the muscularis propria, lamina muscularis mucosae and myofibroblasts lining the crypts.



A moderate to strong cytoplasmic staining must be seen in smooth muscle cells – e.g. vessels
No staining should be seen in lymphocytes and epithelial cells.

# IHC – Protocols and controls for Breast tumours

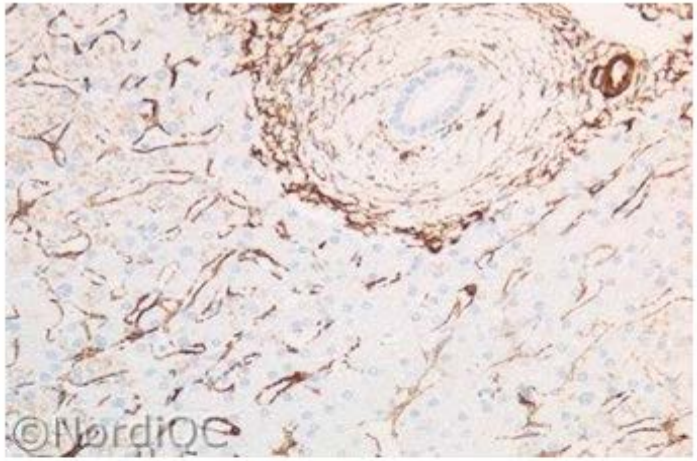

Fig. 1a. Optimal ASMA staining of the liver using the mAb clone 1A4 with HIER. The smooth muscle cells in the portal vessels as well as the perisinusoidal smooth muscle cells show a distinct staining. The liver cells are negative (a weak granular staining is due to lipofuscin).

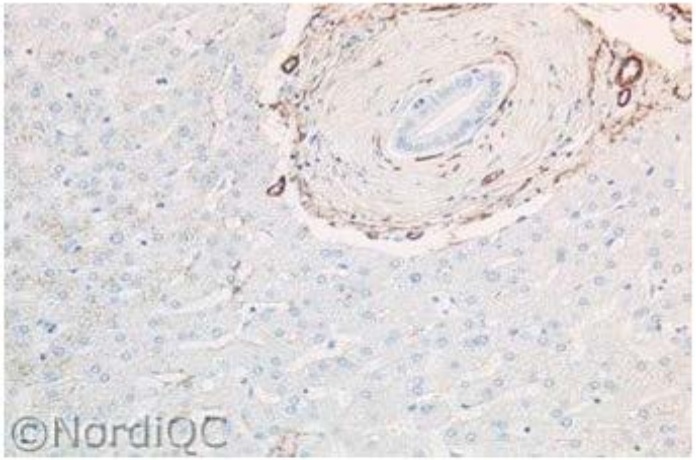

Fig. 1b. Insufficient ASMA staining of the liver using the mAb clone 1A4 in a protocol omitting HIER – same field as in Fig. 1a. The smooth muscle cells in the portal vessels are demonstrated, while the perisinusoidal smooth muscle cells are virtually negative. Also compare with Figs. 2b & 3 b same protocol.

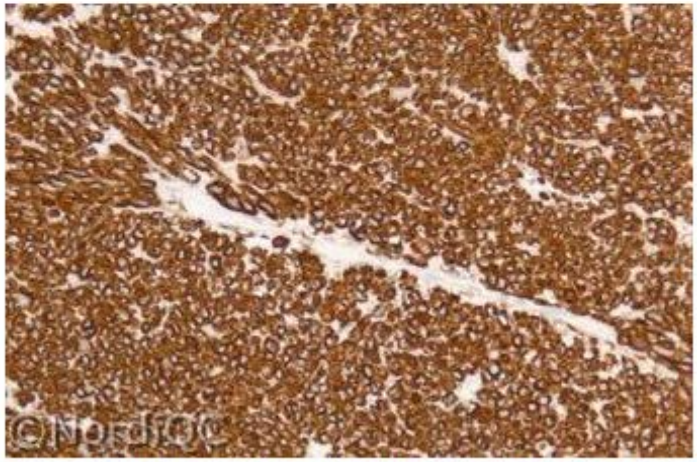

Fig. 2a. Optimal ASMA staining of the leiomyosarcoma tissue no. 3 in the multitissue block using same protocol as in Fig. 1a. Virtually all the neoplastic cells show a strong and distinct reaction with no background reaction.

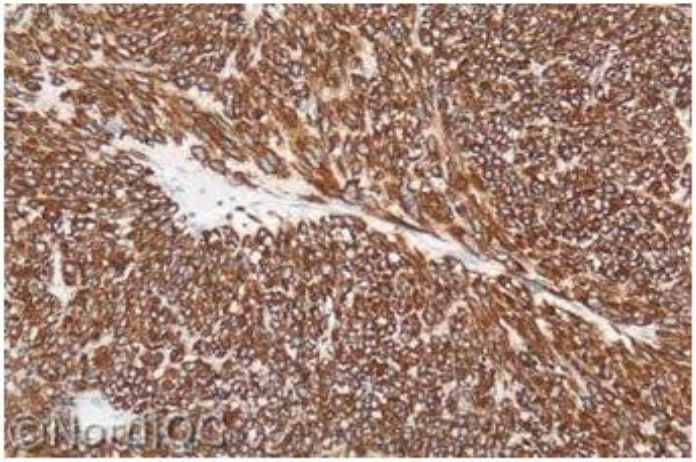

Fig. 2b. ASMA staining of the leiomyosarcoma tissue no. 3 in the multitissue block using same insufficient protocol as in Fig. 1b. Virtually all the neoplastic cells show a strong and distinct reaction with no background reaction – same field as in Fig. 2a. However, also compare with Fig. 3b – same protocol.

# IHC – Protocols and controls for Breast tumours

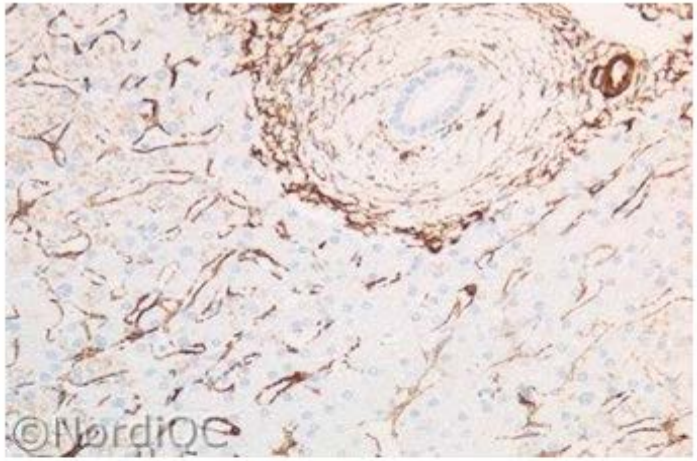

Fig. 1a. Optimal ASMA staining of the liver using the mAb clone 1A4 with HIER. The smooth muscle cells in the portal vessels as well as the perisinusoidal smooth muscle cells show a distinct staining. The liver cells are negative (a weak granular staining is due to lipofuscin).

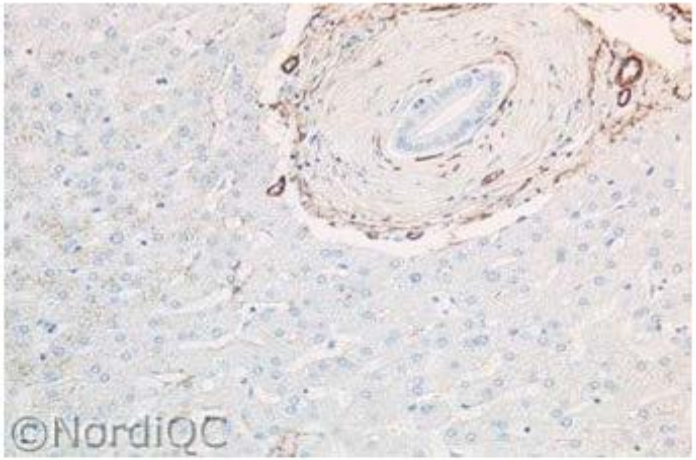

Fig. 1b. Insufficient ASMA staining of the liver using the mAb clone 1A4 in a protocol omitting HIER – same field as in Fig. 1a. The smooth muscle cells in the portal vessels are demonstrated, while the perisinusoidal smooth muscle cells are virtually negative. Also compare with Figs. 2b & 3 b same protocol.

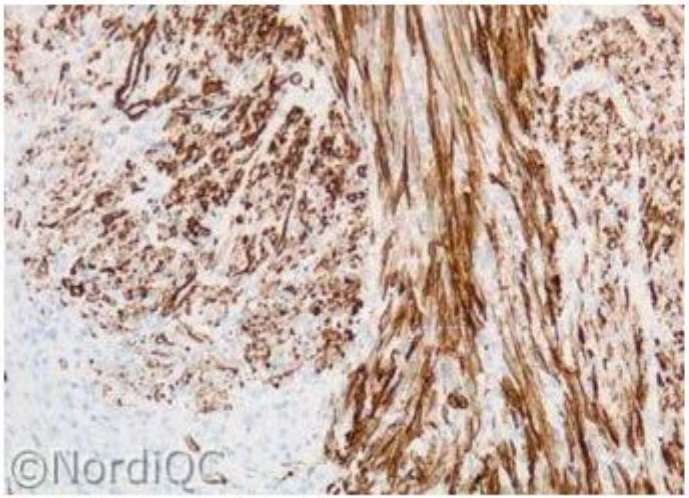

Fig. 3a. Optimal ASMA staining of the leiomyosarcoma tissue no. 4 in the multitissue block using same protocol as in Fig. 1a. Virtually all the neoplastic cells show a moderate to strong and distinct reaction with no background reaction.

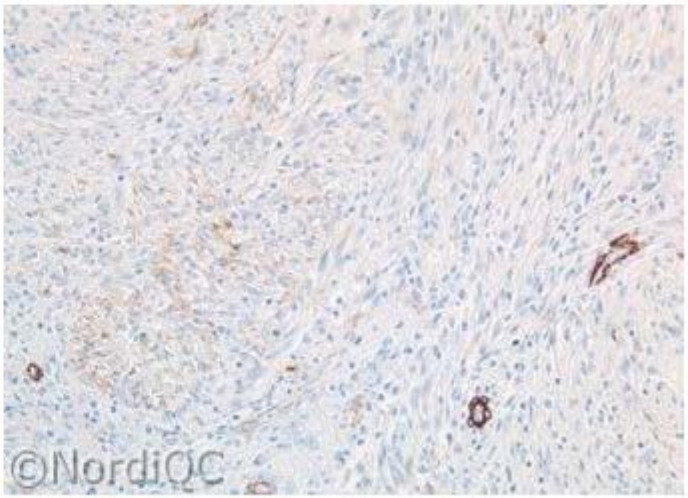

Fig. 3b. Insufficient ASMA staining of the leiomyosarcoma tissue no. 4 in the multitissue block using same protocol as in Figs. 1b & 2b. Only scattered neoplastic cells show a weak reaction – same field as in Fig. 3a.

# IHC – Protocols and controls for Breast tumours

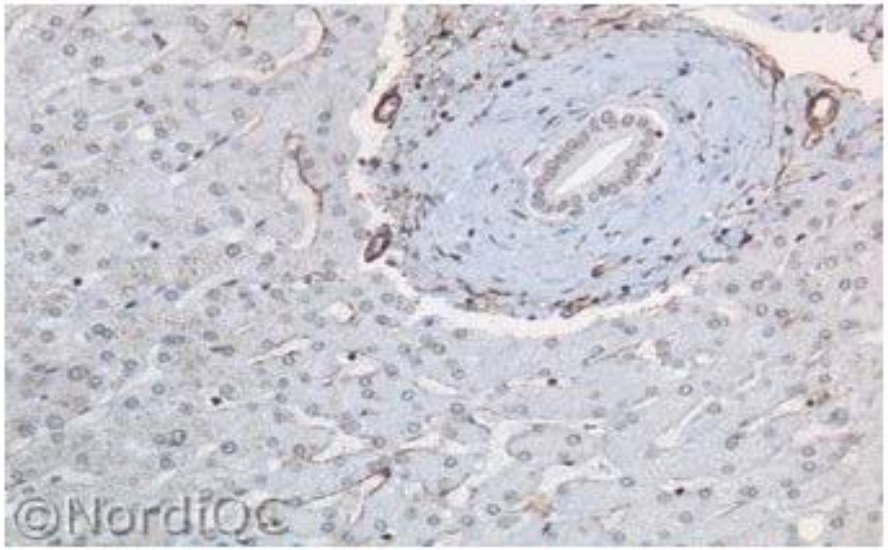

Fig. 4a. Insufficient ASMA staining of the liver using the mAb clone 1A4 with HIER in Cell Conditioning 1 (CC1) on the BenchMark XT, Ventana.
Scattered perisinusoidal smooth muscle cells are demonstrated, but the liver cells and the epithelial cells of the bile duct show a false positive nuclear reaction. This pattern was frequently seen when the mAb clone 1A4 was applied with HIER in CC1 and stained on the BenchMark XT, Ventana. Compare with Fig. 1a.

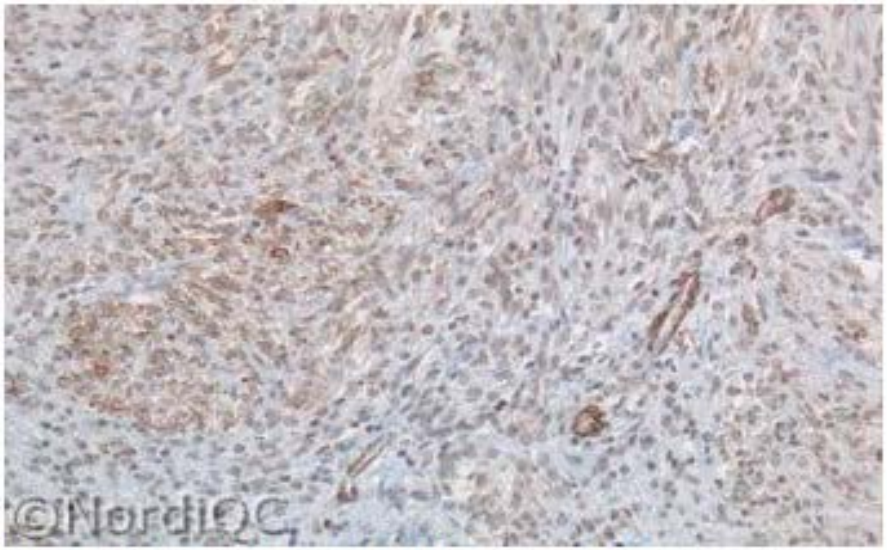

Fig. 4b. Left: Insufficient ASMA staining of the leiomyosarcoma tissue no. 4 in the multi block using same protocol as in Fig. 4a. The neoplastic cells show a false positive positive nuclear reaction, while the specific cytoplasmic reaction is virtually absent. Compare with Fig. 3a - same field.

Table 3. **Proportion of optimal results for ASMA for the most commonly used antibody as concentrate on the 3 main IHC systems***

| Concentrated antibodies | **Dako Autostainer Link / Classic** | | **Ventana BenchMark XT / Ultra** | | **Leica Bond III / Max** | |
|---|---|---|---|---|---|---|
| | TRS pH 9.0 | TRS pH 6.1 | CC1 pH 8.5 | CC2 pH 6.0 | ER2 pH 9.0 | ER1 pH 6.0 |
| mAb clone **1A4** | 14/25** (56%) | 0/2 | 1/29 (3%) | 0/2 | 5/7 (71%) | 1/3 |

* Antibody concentration applied as listed above, HIER buffers and detection kits used as provided by the vendors of the respective systems.
** (number of optimal results/number of laboratories using this buffer)

## Protocol for ASMA depending on IHC stainer

| mAb clone 1A4 (Dako*) | Dako AS48 | Leica Bond III | VMS Dako Ultra Omnis |
|---|---|---|---|
| Titre | 1:100-500* / RTU | 1:200-500* |  |
| Retrieval | HIER TRS High | HIER ER 2 | |
| Detection | 2- or 3-step | 3-step | |

# IHC – Protocols and controls for Breast tumours

**Performance history**
This was the fourth NordiQC assessment of ASMA and as shown in table 2 the pass rates have been constant at a relatively low level throughout all runs.

Table 2. **Proportion of sufficient results for ASMA in the four NordiQC runs performed**

| | Run 10 2004 | Run 21 2007 | Run 27 2009 | Run 44 2015 |
|---|---|---|---|---|
| Participants, n= | 71 | 106 | 124 | 234 |
| Sufficient results | 62% | 63% | 64% | 60% |

**Conclusion**
The mAb clones **1A4**, **asm-1** and rmAb clone **EP188** could all be used to obtain an optimal staining result. Using the two most widely used ASMA antibodies (clone 1A4 and asm-1) HIER and careful calibration of the titre of the primary antibody were the main prerequisites for optimal results.
The performance of clone 1A4 seems to be influenced by the stainer platform as a significantly reduced proportion of sufficient results was observed when used on the Ventana BenchMark platform compared to Dako Autostainer and Leica BOND platforms.

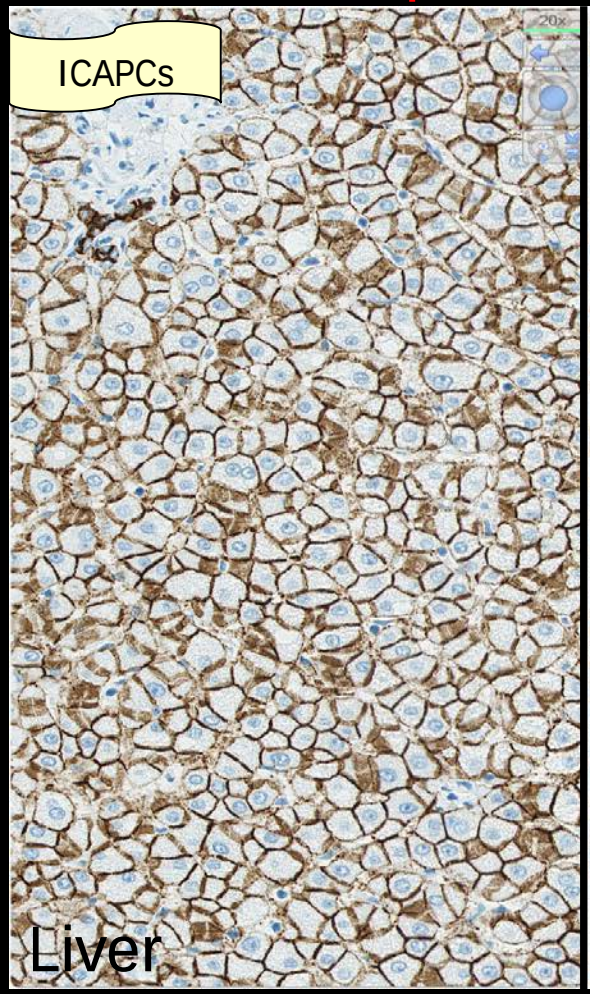
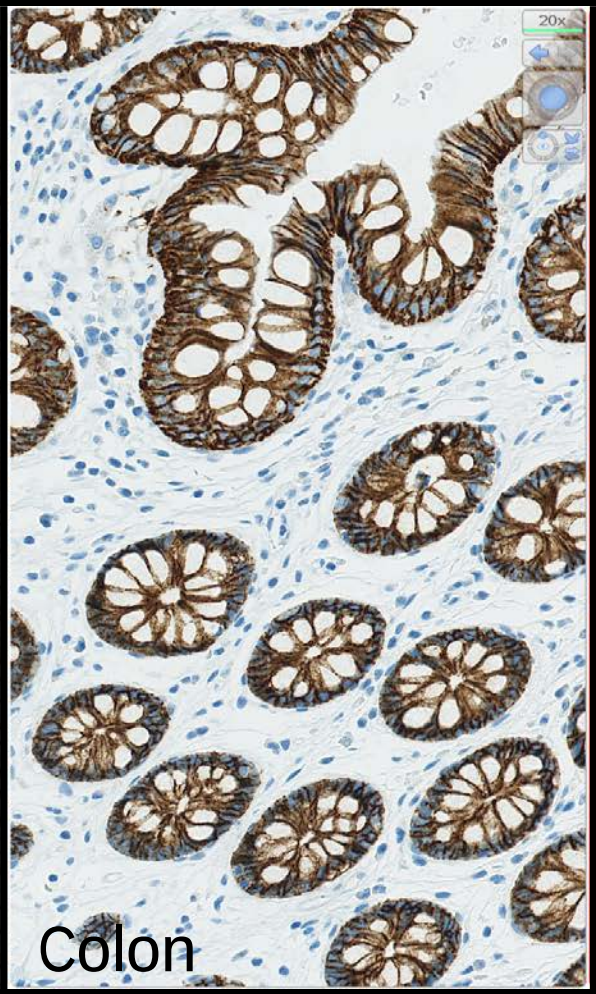
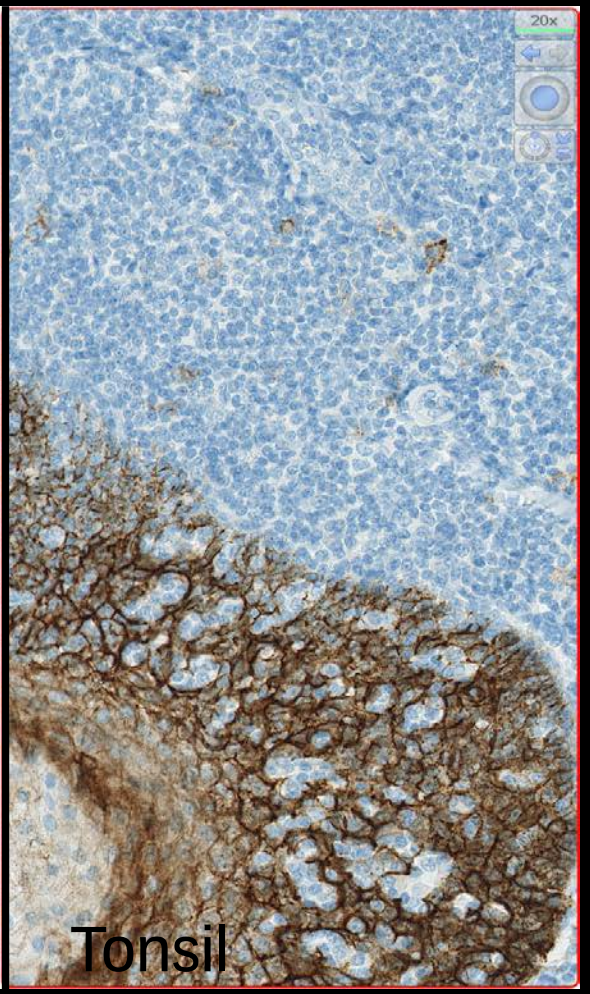
## ECAD reaction pattern



An at least weak to moderate membranous staining reaction of virtually all the hepatocytes.



A moderate to strong, distinct membranous staining reaction of virtually all the columnar epithelial cells in the colon / appendix.



A moderate to strong, distinct membranous staining reaction of virtually all squamous epithelial cells. No staining reaction of the vast majority of lymphocytes.

# IHC – Protocols and controls for Breast tumours
